

# Block-structured Adaptive Finite Volume Methods in C++

The AMROC Framework for Parallel AMR and Shock-Induced  
Combustion Simulation

Short course at Xiamen University, 18th July to 22nd July 2016

Ralf Deiterding

University of Southampton  
Engineering and the Environment  
Highfield Campus, Southampton SO17 1BJ, UK

E-mail: r.deiterding@soton.ac.uk

# Structure of the lectures

1. Fundamentals (18th)
  - ▶ Conservation laws
  - ▶ Finite volume methods
  - ▶ Upwind schemes
2. Structured AMR for hyperbolic problems (19th)
  - ▶ Meshes and adaptation
  - ▶ Presentation of all algorithmic components
  - ▶ Parallelization
3. Hyperbolic AMROC solvers (20th)
  - ▶ Higher-order methods
  - ▶ AMROC design
  - ▶ Clawpack and WENO solvers in AMROC
4. Numerical methods for combustion research (20th)
  - ▶ Consideration of non-Cartesian geometries
  - ▶ Numerical methods for the inviscid reactive equations

## Structure of the lectures - II

5. Detonation simulation (21th)
  - ▶ Examples of ignition and detonation structure simulation
  - ▶ Extensions to viscous reactive equations
6. Fluid-structure interaction (FSI) simulation (22th)
  - ▶ Examples of detonation-driven FSI
7. Lattice Boltzmann methods (22th)
  - ▶ Adaptive LBM
  - ▶ Aerodynamics computations
8. Further topics and software demo of AMROC (22th)
  - ▶ Adaptive multigrid method
  - ▶ Installation of AMROC on Linux
  - ▶ Running examples

- Flux-vector splitting

# Hyperbolic Conservation Laws

$$\frac{\partial}{\partial t} \mathbf{q}(\mathbf{x}, t) + \sum_{n=1}^d \frac{\partial}{\partial x_n} \mathbf{f}_n(\mathbf{q}(\mathbf{x}, t)) = \mathbf{s}(\mathbf{q}(\mathbf{x}, t)), \quad D \subset \{(\mathbf{x}, t) \in \mathbb{R}^d \times \mathbb{R}_0^+ \} \quad (1)$$

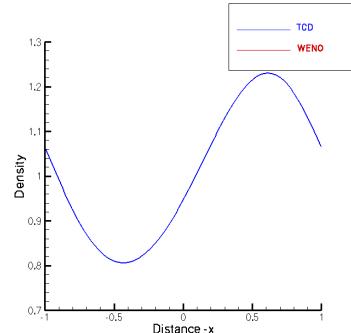

$\mathbf{q} = \mathbf{q}(\mathbf{x}, t) \in S \subset \mathbb{R}^M$  - vector of state,  $\mathbf{f}_n(\mathbf{q}) \in C^1(S, \mathbb{R}^M)$  - flux functions,  
 $\mathbf{s}(\mathbf{q}) \in C^1(S, \mathbb{R}^M)$  - source term

## Definition (Hyperbolicity)

$\mathbf{A}(\mathbf{q}, \nu) = \nu_1 \mathbf{A}_1(\mathbf{q}) + \dots + \nu_d \mathbf{A}_d(\mathbf{q})$  with  $\mathbf{A}_n(\mathbf{q}) = \partial \mathbf{f}_n(\mathbf{q}) / \partial \mathbf{q}$  has  $M$  real eigenvalues  $\lambda_1(\mathbf{q}, \nu) \leq \dots \leq \lambda_M(\mathbf{q}, \nu)$  and  $M$  linear independent right eigenvectors  $\mathbf{r}_m(\mathbf{q}, \nu)$ .

If  $\mathbf{f}_n(\mathbf{q})$  is nonlinear, classical solutions  $\mathbf{q}(\mathbf{x}, t) \in C^1(D, S)$  do not generally exist, not even for  $\mathbf{q}_0(\mathbf{x}) \in C^1(\mathbb{R}^d, S)$  [Majda, 1984], [Godlewski and Raviart, 1996], [Kröner, 1997]

Example: Euler equations

## Characteristic variables

Consider the first-order partial differential equation

$$\frac{\partial \mathbf{q}}{\partial t} + \mathbf{A}(\mathbf{q}) \frac{\partial \mathbf{q}}{\partial x} = 0 \quad (2)$$

For  $\mathbf{A} = \text{const.}$  Eq. (2) is called linear, for  $\mathbf{A} = \mathbf{A}(\mathbf{q}(x, t))$  it is called quasi-linear. For a hyperbolic system,  $\mathbf{A}$  is diagonalizable as

$$\mathbf{R}^{-1} \mathbf{A} \mathbf{R} = \Lambda$$

$\mathbf{R}$  is the matrix of right eigenvectors (column-wise)

$$\mathbf{R} = (\mathbf{r}_1 | \cdots | \mathbf{r}_M)$$

and  $\Lambda$  the diagonal matrix of eigenvalues

$$\Lambda = \begin{pmatrix} \lambda_1 & 0 & 0 \\ 0 & \ddots & 0 \\ 0 & 0 & \lambda_M \end{pmatrix}$$

## Characteristic variables - II

Multiplying (2) with  $\mathbf{R}^{-1}$  gives

$$\mathbf{R}^{-1} \frac{\partial \mathbf{q}}{\partial t} + \mathbf{R}^{-1} \mathbf{A} \frac{\partial \mathbf{q}}{\partial x} = 0$$

with  $\mathbf{R}^{-1} d\mathbf{q} = d\mathbf{v}$  this becomes

$$\frac{\partial \mathbf{v}}{\partial t} + \mathbf{R}^{-1} \mathbf{A} \mathbf{R} \frac{\partial \mathbf{v}}{\partial x} = 0$$

or

$$\frac{\partial \mathbf{v}}{\partial t} + \Lambda \frac{\partial \mathbf{v}}{\partial x} = 0$$

which is just a set of decoupled independent advection equations for the components, i.e.,

$$\frac{\partial \mathbf{v}_m}{\partial t} + \lambda_m \frac{\partial \mathbf{v}_m}{\partial x} = 0 \quad \text{for } m = 1, \dots, M \quad (3)$$

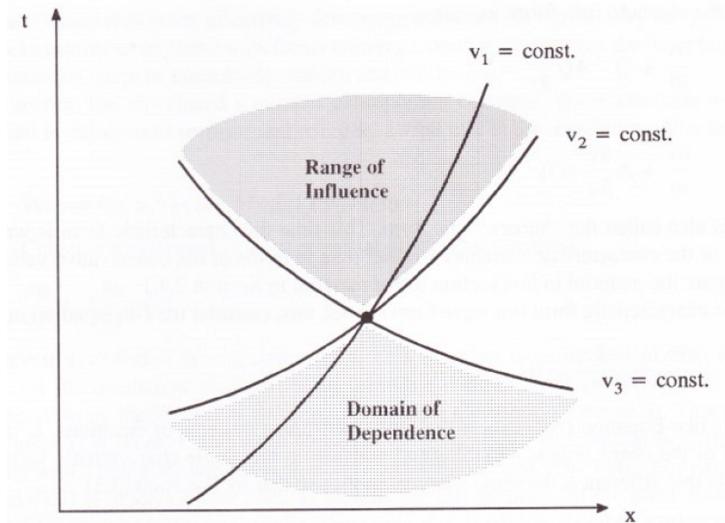

(3) is a wave equation but note that in the general quasi-linear case the eigenvalues can dependent on all  $v_m$ , i.e.  $\lambda_m = \lambda_m(v_1, \dots, v_M)$  Nevertheless, an analysis as for the wave equations shows

$$\mathbf{v}_m = \text{const.} \quad \text{for } \frac{dx}{dt} = \lambda_m$$

# Wavefronts

The curves  $dx = \lambda_m dt$  are called wavefronts or characteristics,  $v_m$  are the characteristic variables.

The characteristics define how influence spreads in the  $x - t$  plane. A point in the  $x - t$  plane is only influenced by points at earlier times in a finite domain of dependence and influences only points in a finite range of influence.

Typical wave diagram for vector model problem.

# Weak solutions

Integral form (Gauss's theorem):

$$\int_{\Omega} \mathbf{q}(\mathbf{x}, t + \Delta t) d\mathbf{x} - \int_{\Omega} \mathbf{q}(\mathbf{x}, t) d\mathbf{x} \\ + \sum_{n=1}^d \int_t^{t+\Delta t} \int_{\partial\Omega} \mathbf{f}_n(\mathbf{q}(\mathbf{o}, t)) \sigma_n(\mathbf{o}) d\mathbf{o} dt = \int_t^{t+\Delta t} \int_{\Omega} \mathbf{s}(\mathbf{q}(\mathbf{x}, t)) d\mathbf{x}$$

**Theorem (Weak solution)**

$\mathbf{q}_0 \in L_{loc}^\infty(\mathbb{R}^d, S)$ .  $\mathbf{q} \in L_{loc}^\infty(D, S)$  is weak solution if  $\mathbf{q}$  satisfies

$$\int_0^\infty \int_{\mathbb{R}^d} \left[ \frac{\partial \varphi}{\partial t} \cdot \mathbf{q} + \sum_{n=1}^d \frac{\partial \varphi}{\partial x_n} \cdot \mathbf{f}_n(\mathbf{q}) - \varphi \cdot \mathbf{s}(\mathbf{q}) \right] d\mathbf{x} dt + \int_{\mathbb{R}^d} \varphi(\mathbf{x}, 0) \cdot \mathbf{q}_0(\mathbf{x}) d\mathbf{x} = 0$$

for any test function  $\varphi \in C_0^1(D, S)$

# Rankine-Hugoniot relations

Consider the 1d version of (1),  $s(\mathbf{q}) = 0$  integrated over interval  $[x, x + dx] \times [t, t + dt]$

$$\int_x^{x+dx} \mathbf{q}(x', t + dt) dx' - \int_x^{x+dx} \mathbf{q}(x', t) dx' = - \int_t^{t+dt} [\mathbf{f}(\mathbf{q}(x + dx, t')) - \mathbf{f}(\mathbf{q}(x, t'))] dt'$$

Assume a discontinuity traveling with speed

$$S = \frac{dx}{dt}$$

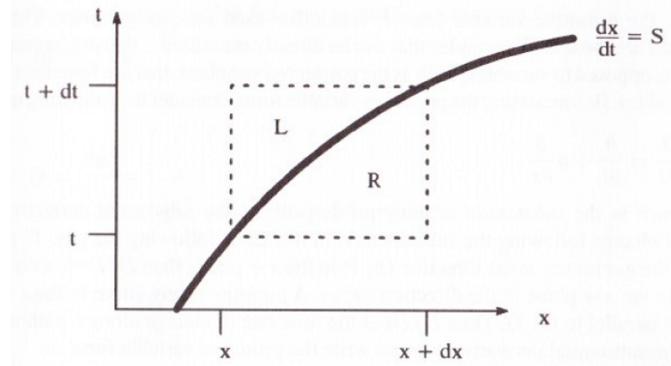

State on the left of discontinuity is index with L, on the right with R Inserting the states into (8) gives

$$(\mathbf{q}_L - \mathbf{q}_R) dx = - [\mathbf{f}(\mathbf{q}_R) - \mathbf{f}(\mathbf{q}_L)] dt$$

Or using the above speed definition

$$S(\mathbf{q}_R - \mathbf{q}_L) = \mathbf{f}(\mathbf{q}_R) - \mathbf{f}(\mathbf{q}_L)$$

This is called Rankine-Hugoniot jump relation. Note the form  $\mathbf{f}(\mathbf{q}_R) = \mathbf{f}(\mathbf{q}_L)$  for  $S = 0$  from which, for instance, the shock relations for Euler equations are derived.

# Entropy solutions

Select physical weak solution as  $\lim_{\varepsilon \rightarrow 0} \mathbf{q}_\varepsilon = \mathbf{q}$  almost everywhere in  $D$  of

$$\frac{\partial \mathbf{q}_\varepsilon}{\partial t} + \sum_{n=1}^d \frac{\partial \mathbf{f}_n(\mathbf{q}_\varepsilon)}{\partial x_n} - \varepsilon \sum_{n=1}^d \frac{\partial^2 \mathbf{q}_\varepsilon}{\partial x_n^2} = \mathbf{s}(\mathbf{q}_\varepsilon), \quad \mathbf{x} \in \mathbb{R}^d, \quad t > 0$$

## Theorem (Entropy condition)

Assume existence of entropy  $\eta \in C^2(S, \mathbb{R})$  and entropy fluxes  $\psi_n \in C^1(S, \mathbb{R})$  that satisfy

$$\frac{\partial \eta(\mathbf{q})}{\partial \mathbf{q}}^T \cdot \frac{\partial \mathbf{f}_n(\mathbf{q})}{\partial \mathbf{q}} = \frac{\partial \psi_n(\mathbf{q})}{\partial \mathbf{q}}^T, \quad n = 1, \dots, d$$

then  $\lim_{\varepsilon \rightarrow 0} \mathbf{q}_\varepsilon = \mathbf{q}$  almost everywhere in  $D$  is weak solution and satisfies

$$\frac{\partial \eta(\mathbf{q})}{\partial t} + \sum_{n=1}^d \frac{\partial \psi_n(\mathbf{q})}{\partial x_n} \leq \frac{\partial \eta(\mathbf{q})}{\partial \mathbf{q}}^T \cdot \mathbf{s}(\mathbf{q})$$

in the sense of distributions. Proof: [Godlewski and Raviart, 1996]

# Entropy solutions II

## Definition (Entropy solution)

Weak solution  $\mathbf{q}$  is called an entropy solution if  $\mathbf{q}$  satisfies

$$\int_0^\infty \int_{\mathbb{R}^d} \left[ \frac{\partial \varphi}{\partial t} \eta(\mathbf{q}) + \sum_{n=1}^d \frac{\partial \varphi}{\partial x_n} \psi_n(\mathbf{q}) - \varphi \frac{\partial \eta(\mathbf{q})}{\partial \mathbf{q}}^T \cdot \mathbf{s}(\mathbf{q}) \right] d\mathbf{x} dt + \int_{\mathbb{R}^d} \varphi(\mathbf{x}, 0) \eta(\mathbf{q}_0(\mathbf{x})) d\mathbf{x} \geq 0$$

for all entropy functions  $\eta(\mathbf{q})$  and all test functions  $\varphi \in C_0^1(D, \mathbb{R}_0^+)$ ,  $\varphi \geq 0$

## Theorem (Jump conditions)

An entropy solution  $\mathbf{q}$  is a classical solution  $\mathbf{q} \in C^1(D, S)$  almost everywhere and satisfies the Rankine-Hugoniot (RH) jump condition

$$(\mathbf{q}^+ - \mathbf{q}^-) \sigma_t + \sum_{n=1}^d (\mathbf{f}_n(\mathbf{q}^+) - \mathbf{f}_n(\mathbf{q}^-)) \sigma_n = \mathbf{0}$$

and the jump inequality

$$(\eta(\mathbf{q}^+) - \eta(\mathbf{q}^-)) \sigma_t + \sum_{n=1}^d (\psi_n(\mathbf{q}^+) - \psi_n(\mathbf{q}^-)) \sigma_n \leq 0$$

along discontinuities. Proof: [Godlewski and Raviart, 1996]

# Euler equations

$$\frac{\partial \rho}{\partial t} + \frac{\partial}{\partial x_n} (\rho u_n) = 0$$

$$\frac{\partial}{\partial t} (\rho u_k) + \frac{\partial}{\partial x_n} (\rho u_k u_n + \delta_{kn} p) = 0 , \quad k = 1, \dots, d$$

$$\frac{\partial}{\partial t} (\rho E) + \frac{\partial}{\partial x_n} (u_n (\rho E + p)) = 0$$

with polytrope gas equation of state

$$p = (\gamma - 1) \left( \rho E - \frac{1}{2} \rho u_n u_n \right)$$

have structure

$$\partial_t \mathbf{q}(\mathbf{x}, t) + \nabla \cdot \mathbf{f}(\mathbf{q}(\mathbf{x}, t)) = 0$$

# Characteristic form of the Euler equations

The Jacobian can be written in different forms, using

$$a^2 = \gamma \frac{p}{\rho}, \quad h = e + \frac{p}{\rho}, \quad H = h + \frac{1}{2} u^2 \quad \Rightarrow \quad H = \frac{a^2}{\gamma - 1} + \frac{1}{2} u^2$$

For

$$\mathbf{A} = \begin{bmatrix} 0 & 1 & 0 \\ \frac{\gamma-3}{2} u^2 & (3-\gamma)u & \gamma-1 \\ -uH + \frac{1}{2}(\gamma-1)u^3 & H - (\gamma-1)u^2 & \gamma u \end{bmatrix}$$

The matrices

$$\mathbf{R} = \begin{bmatrix} 1 & 1 & 1 \\ u-a & u & u+a \\ H-ua & \frac{1}{2}u^2 & H+ua \end{bmatrix}$$

$$\mathbf{R}^{-1} = \frac{1}{2a^2} \begin{bmatrix} \frac{1}{2}(\gamma-1)u^2 + ua & (1-\gamma)u - a & \gamma - 1 \\ 2a^2 - (\gamma-1)u^2 & 2(\gamma-1)u & 2(1-\gamma) \\ \frac{1}{2}(\gamma-1)u^2 - ua & (1-\gamma)u + a & \gamma - 1 \end{bmatrix}$$

diagonalize  $\mathbf{A}$  as

## Characteristic form of the Euler equations - II

$$\mathbf{R}^{-1} \mathbf{A} \mathbf{R} = \Lambda = \begin{pmatrix} u-a & 0 & 0 \\ 0 & u & 0 \\ 0 & 0 & u+a \end{pmatrix}$$

The transformation  $\mathbf{R}^{-1} d\mathbf{q} = \mathbf{R}^{-1} (d\rho, d(\rho u), d(\rho E))^T$  into characteristic variables therefore leads to

$$\frac{\partial \mathbf{v}^-}{\partial t} + (u-a) \frac{\partial \mathbf{v}^-}{\partial x} = 0$$

$$\frac{\partial \mathbf{v}_0}{\partial t} + u \frac{\partial \mathbf{v}_0}{\partial x} = 0$$

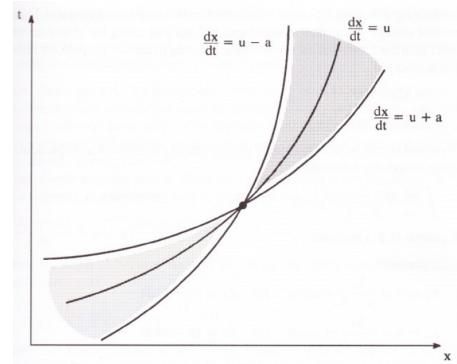

$$\frac{\partial \mathbf{v}^+}{\partial t} + (u+a) \frac{\partial \mathbf{v}^+}{\partial x} = 0$$

with

$$d\mathbf{v}^- = du - \frac{dp}{\rho a} = 0 \quad \text{for} \quad dx = (u-a)dt$$

$$d\mathbf{v}_0 = d\rho - \frac{dp}{a^2} = 0 \quad \text{for} \quad dx = u dt$$

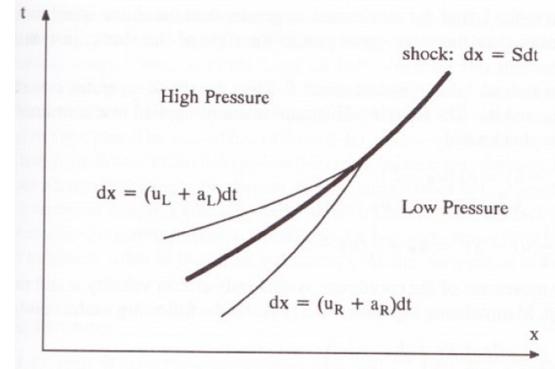

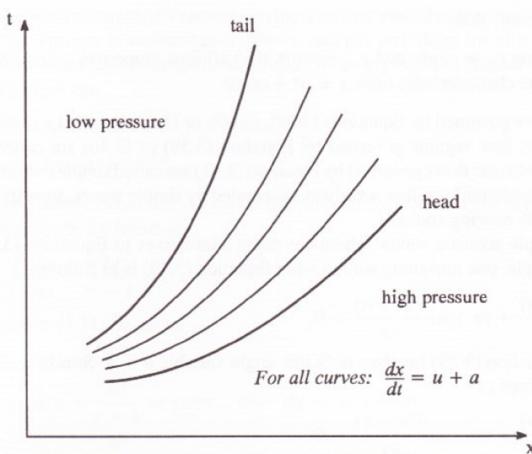

$$d\mathbf{v}^+ = du + \frac{dp}{\rho a} = 0 \quad \text{for} \quad dx = (u+a)dt$$

The crossing of characteristics causes a shock wave.

# Rarefaction and shock waves in the $x - t$ plane

Consider the two enclosing characteristics  $b_1(t) \leq x \leq y \leq b_2(t)$

Shocks:

Rarefaction:

$$u(x, t) \pm a(x, t) \leq u(y, t) \pm a(y, t)$$

$$u(x, t) \pm a(x, t) \geq u(y, t) \pm a(y, t)$$

which gives for the shock speed

$$u_L \pm a_L \geq S \geq u_R \pm a_R$$

# Navier-Stokes equations

$$\begin{aligned}\frac{\partial \rho}{\partial t} + \frac{\partial}{\partial x_n} (\rho u_n) &= 0 \\ \frac{\partial}{\partial t} (\rho u_k) + \frac{\partial}{\partial x_n} (\rho u_k u_n + \delta_{kn} p - \tau_{kn}) &= 0 , \quad k = 1, \dots, d \\ \frac{\partial}{\partial t} (\rho E) + \frac{\partial}{\partial x_n} (u_n (\rho E + p) + q_n - \tau_{nj} u_j) &= 0\end{aligned}$$

with stress tensor

$$\tau_{kn} = \mu \left( \frac{\partial u_n}{\partial x_k} + \frac{\partial u_k}{\partial x_n} \right) - \frac{2}{3} \mu \frac{\partial u_j}{\partial x_j} \delta_{kn}$$

and heat conduction

$$q_n = -\lambda \frac{\partial T}{\partial x_n}$$

have structure

$$\partial_t \mathbf{q}(\mathbf{x}, t) + \nabla \cdot \mathbf{f}(\mathbf{q}(\mathbf{x}, t)) + \nabla \cdot \mathbf{h}(\mathbf{q}(\mathbf{x}, t), \nabla \mathbf{q}(\mathbf{x}, t)) = 0$$

Type can be either hyperbolic or parabolic

## Navier-Stokes equations for multiple species

For multiple species with chemical reaction, the Navier-Stokes equations would be extended to

$$\begin{aligned}\frac{\partial \rho_i}{\partial t} + \frac{\partial}{\partial x_n}(\rho_i u_n + \rho \nu_{in}) &= W_i \dot{\omega}_i, \quad i = 1, \dots, N \\ \frac{\partial}{\partial t}(\rho u_k) + \frac{\partial}{\partial x_n}(\rho u_k u_n + \delta_{kn} p - \tau_{kn}) &= 0, \quad k = 1, \dots, d \\ \frac{\partial}{\partial t}(\rho E) + \frac{\partial}{\partial x_n}(u_n(\rho E + p) + q_n + \rho \sum_j h_j \nu_{jn} - \tau_{nj} u_j) &= 0\end{aligned}$$

with diffusivities

$$\nu_{in} = D_i \frac{\partial Y_i}{\partial x_n}$$

of species  $i$  into the mixture (note difference to binary diffusivities). The equation of state

$$p = \sum_i \rho_i R_i T$$

still contains the temperature, which complicates the analysis. The structure is

$$\partial_t \mathbf{q}(\mathbf{x}, t) + \nabla \cdot \mathbf{f}(\mathbf{q}(\mathbf{x}, t)) + \nabla \cdot \mathbf{h}(\mathbf{q}(\mathbf{x}, t), \nabla \mathbf{q}(\mathbf{x}, t)) = \mathbf{s}(\mathbf{q}(\mathbf{x}, t))$$

# Outline

## Conservation laws

- Mathematical background
- Characteristic information
- Weak and entropy solutions
- Characteristic form of the Euler equations
- Navier-Stokes equations

## Finite volume methods

- Basics of finite difference methods
- Splitting methods, second derivatives

## Upwind schemes

- The linear Riemann problem
- Flux-difference splitting
- Flux-vector splitting

# Derivation

Assume  $\partial_t \mathbf{q} + \partial_x \mathbf{f}(\mathbf{q}) + \partial_x \mathbf{h}(\mathbf{q}(\cdot, \partial_x \mathbf{q})) = \mathbf{s}(\mathbf{q})$

Time discretization  $t_n = n\Delta t$ , discrete volumes

$$I_j = [x_j - \frac{1}{2}\Delta x, x_j + \frac{1}{2}\Delta x] [= [x_{j-1/2}, x_{j+1/2}]$$

Using approximations  $\mathbf{Q}_j(t) \approx \frac{1}{|I_j|} \int_{I_j} \mathbf{q}(\mathbf{x}, t) d\mathbf{x}$ ,  $\mathbf{s}(\mathbf{Q}_j(t)) \approx \frac{1}{|I_j|} \int_{I_j} \mathbf{s}(\mathbf{q}(\mathbf{x}, t)) d\mathbf{x}$

and numerical fluxes

$$\mathbf{F}(\mathbf{Q}_j(t), \mathbf{Q}_{j+1}(t)) \approx \mathbf{f}(\mathbf{q}(x_{j+1/2}, t)), \quad \mathbf{H}(\mathbf{Q}_j(t), \mathbf{Q}_{j+1}(t)) \approx \mathbf{h}(\mathbf{q}(x_{j+1/2}, t), \nabla \mathbf{q}(x_{j+1/2}, t))$$

yields after integration (Gauss theorem)

$$\begin{aligned} \mathbf{Q}_j(t_{n+1}) &= \mathbf{Q}_j(t_n) - \frac{1}{\Delta x} \int_{t_n}^{t_{n+1}} [\mathbf{F}(\mathbf{Q}_j(t), \mathbf{Q}_{j+1}(t)) - \mathbf{F}(\mathbf{Q}_{j-1}(t), \mathbf{Q}_j(t))] dt - \\ &\quad \frac{1}{\Delta x} \int_{t_n}^{t_{n+1}} [\mathbf{H}(\mathbf{Q}_j(t), \mathbf{Q}_{j+1}(t)) - \mathbf{H}(\mathbf{Q}_{j-1}(t), \mathbf{Q}_j(t))] dt + \int_{t_n}^{t_{n+1}} \mathbf{s}(\mathbf{Q}_j(t)) dt \end{aligned}$$

For instance:

$$\begin{aligned} \mathbf{Q}_j^{n+1} &= \mathbf{Q}_j^n - \frac{\Delta t}{\Delta x} \left[ \mathbf{F}(\mathbf{Q}_j^n, \mathbf{Q}_{j+1}^n) - \mathbf{F}(\mathbf{Q}_{j-1}^n, \mathbf{Q}_j^n) \right] - \\ &\quad \frac{\Delta t}{\Delta x} \left[ \mathbf{H}(\mathbf{Q}_j^n, \mathbf{Q}_{j+1}^n) - \mathbf{H}(\mathbf{Q}_{j-1}^n, \mathbf{Q}_j^n) \right] + \Delta t \mathbf{s}(\mathbf{Q}_j^n) dt \end{aligned}$$

# Some classical definitions

( $2s + 1$ )-point difference scheme of the form

$$\mathbf{Q}_j^{n+1} = \mathcal{H}^{(\Delta t)}(\mathbf{Q}_{j-s}^n, \dots, \mathbf{Q}_{j+s}^n)$$

## Definition (Stability)

For each time  $\tau$  there is a constant  $C_S$  and a value  $n_0 \in \mathbb{N}$  such that  $\|\mathcal{H}^{(\Delta t)}(\mathbf{Q}^n)\| \leq C_S$  for all  $n\Delta t \leq \tau$ ,  $n < n_0$

## Definition (Consistency)

If the local truncation error

$$\mathcal{L}^{(\Delta t)}(\mathbf{x}, t) := \frac{1}{\Delta t} [\mathbf{q}(\mathbf{x}, t + \Delta t) - \mathcal{H}^{(\Delta t)}(\mathbf{q}(\cdot, t))]$$

satisfies  $\|\mathcal{L}^{(\Delta t)}(\cdot, t)\| \rightarrow 0$  as  $\Delta t \rightarrow 0$

## Definition (Convergence)

If the global error  $\mathcal{E}^{(\Delta t)}(\mathbf{x}, t) := \mathbf{Q}(\mathbf{x}, t) - \mathbf{q}(\mathbf{x}, t)$  satisfies  $\|\mathcal{E}^{(\Delta t)}(\cdot, t)\| \rightarrow 0$  as  $\Delta t \rightarrow 0$  for all admissible initial data  $\mathbf{q}_0(\mathbf{x})$

# Some classical definitions II

## Definition (Order of accuracy)

$\mathcal{H}(\cdot)$  is accurate of order  $o$  if for all sufficiently smooth initial data  $\mathbf{q}_0(\mathbf{x})$ , there is a constant  $C_L$ , such that the local truncation error satisfies

$$\|\mathcal{L}^{(\Delta t)}(\cdot, t)\| \leq C_L \Delta t^o \text{ for all } \Delta t < \Delta t_0, t \leq \tau$$

## Definition (Conservative form)

If  $\mathcal{H}(\cdot)$  can be written in the form

$$\mathbf{Q}_j^{n+1} = \mathbf{Q}_j^n - \frac{\Delta t}{\Delta x} (\mathbf{F}(\mathbf{Q}_{j-s+1}^n, \dots, \mathbf{Q}_{j+s}^n) - \mathbf{F}(\mathbf{Q}_{j-s}^n, \dots, \mathbf{Q}_{j+s-1}^n))$$

A conservative scheme satisfies

$$\sum_{j \in \mathbb{Z}} \mathbf{Q}_j^{n+1} = \sum_{j \in \mathbb{Z}} \mathbf{Q}_j^n$$

## Definition (Consistency of a conservative method)

If the numerical flux satisfies  $\mathbf{F}(\mathbf{q}, \dots, \mathbf{q}) = \mathbf{f}(\mathbf{q})$  for all  $\mathbf{q} \in S$

# Splitting methods

Solve homogeneous PDE and ODE successively!

$$\begin{aligned}\mathcal{H}^{(\Delta t)} : \quad & \partial_t \mathbf{q} + \nabla \cdot \mathbf{f}(\mathbf{q}) = 0 , \quad \text{IC: } \mathbf{Q}(t_m) \xrightarrow{\Delta t} \tilde{\mathbf{Q}} \\ \mathcal{S}^{(\Delta t)} : \quad & \partial_t \mathbf{q} = \mathbf{s}(\mathbf{q}) , \quad \text{IC: } \tilde{\mathbf{Q}} \xrightarrow{\Delta t} \mathbf{Q}(t_m + \Delta t)\end{aligned}$$

1st-order Godunov splitting:  $\mathbf{Q}(t_m + \Delta t) = \mathcal{S}^{(\Delta t)} \mathcal{H}^{(\Delta t)}(\mathbf{Q}(t_m))$ ,

2nd-order Strang splitting :  $\mathbf{Q}(t_m + \Delta t) = \mathcal{S}^{(\frac{1}{2}\Delta t)} \mathcal{H}^{(\Delta t)} \mathcal{S}^{(\frac{1}{2}\Delta t)}(\mathbf{Q}(t_m))$

1st-order dimensional splitting for  $\mathcal{H}^{(\cdot)}$ :

$$\begin{aligned}\mathcal{X}_1^{(\Delta t)} : \quad & \partial_t \mathbf{q} + \partial_{x_1} \mathbf{f}_1(\mathbf{q}) = 0 , \quad \text{IC: } \mathbf{Q}(t_m) \xrightarrow{\Delta t} \tilde{\mathbf{Q}}^{1/2} \\ \mathcal{X}_2^{(\Delta t)} : \quad & \partial_t \mathbf{q} + \partial_{x_2} \mathbf{f}_2(\mathbf{q}) = 0 , \quad \text{IC: } \tilde{\mathbf{Q}}^{1/2} \xrightarrow{\Delta t} \tilde{\mathbf{Q}}\end{aligned}$$

[Toro, 1999]

## Conservative scheme for diffusion equation

Consider  $\partial_t q - c\Delta q = 0$  with  $c \in \mathbb{R}^+$ , which is readily discretized as

$$Q_{jk}^{n+1} = Q_{jk}^n + c \frac{\Delta t}{\Delta x_1^2} (Q_{j+1,k}^n - 2Q_{jk}^n + Q_{j-1,k}^n) + c \frac{\Delta t}{\Delta x_2^2} (Q_{j,k+1}^n - 2Q_{jk}^n + Q_{j,k-1}^n)$$

or conservatively

$$Q_{jk}^{n+1} = Q_{jk}^n + c \frac{\Delta t}{\Delta x_1} \left( H_{j+\frac{1}{2},k}^1 - H_{j-\frac{1}{2},k}^1 \right) + c \frac{\Delta t}{\Delta x_2} \left( H_{j,k+\frac{1}{2}}^2 - H_{j,k-\frac{1}{2}}^2 \right)$$

Von Neumann stability analysis: Insert single eigenmode  $\hat{Q}(t)e^{ik_1 x_1} e^{ik_2 x_2}$  into discretization

$$\hat{Q}^{n+1} = \hat{Q}^n + C_1 \left( \hat{Q}^n e^{ik_1 \Delta x_1} - 2\hat{Q}^n + \hat{Q}^n e^{-ik_1 \Delta x_1} \right) + C_2 \left( \hat{Q}^n e^{ik_2 \Delta x_2} - 2\hat{Q}^n + \hat{Q}^n e^{-ik_2 \Delta x_2} \right)$$

with  $C_\ell = c \frac{\Delta t}{\Delta x_\ell^2}$ ,  $\ell = 1, 2$ , which gives after inserting  $e^{ik_\ell x_\ell} = \cos(k_\ell x_\ell) + i \sin(k_\ell x_\ell)$

$$\hat{Q}^{n+1} = \hat{Q}^n (1 + 2C_1(\cos(k_1 \Delta x_1) - 1) + 2C_2(\cos(k_2 \Delta x_2) - 1))$$

Stability requires

$$|1 + 2C_1(\cos(k_1 \Delta x_1) - 1) + 2C_2(\cos(k_2 \Delta x_2) - 1)| \leq 1$$

i.e.

$$|1 - 4C_1 - 4C_2| \leq 1$$

from which we derive the stability condition

$$0 \leq c \left( \frac{\Delta t}{\Delta x_1^2} + \frac{\Delta t}{\Delta x_2^2} \right) \leq \frac{1}{2}$$

# The Riemann problem in the linear case

Consider the linear hyperbolic equation (i.e.  $\mathbf{A} = \text{const.}$  )

$$\frac{\partial}{\partial t} \mathbf{q}(x, t) + \mathbf{A} \frac{\partial}{\partial x} \mathbf{q}(x, t) = 0$$

Assume (for simplicity) that  $\mathbf{A}$  has  $M$  distinct real eigenvalues  $\lambda_1 < \dots < \lambda_M$  with  $M$  linear independent right eigenvectors  $\mathbf{r}_m$ .

We can readily apply the characteristic transformation  $\mathbf{R}^{-1} \mathbf{q} = \mathbf{v}$  to obtain

$$\frac{\partial \mathbf{v}}{\partial t} + \mathbf{\Lambda} \frac{\partial \mathbf{v}}{\partial x} = 0$$

or

$$\frac{\partial v_m}{\partial t} + \lambda_m \frac{\partial v_m}{\partial x} = 0 \quad \text{for all } m = 1, \dots, M$$

Each characteristic variable  $v_m$  changes only across the characteristic line associated to  $\lambda_m$ .

Since the entire problem is linear, we can simply sum up all these jumps  $\Delta v_m$  successively to connect the RP states  $\mathbf{v}_L, \mathbf{v}_R$  in characteristic variables.

## The Riemann problem in the linear case - II

Example of a linear 3 PDE system:

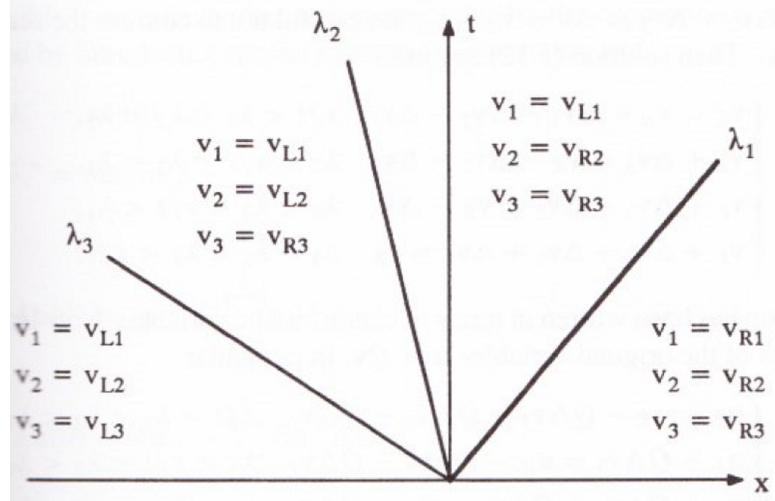

Introducing the jumps

$$\Delta \mathbf{v}_1 = [v_{R1} - v_{L1}, 0, 0]^T$$

$$\Delta \mathbf{v}_2 = [0, v_{R2} - v_{L2}, 0]^T$$

$$\Delta \mathbf{v}_3 = [0, 0, v_{R3} - v_{L3}]^T$$

the solution reads

$$\mathbf{v}\left(\frac{x}{t}\right) = \begin{cases} \mathbf{v}_L = \mathbf{v}_R - \Delta \mathbf{v}_3 - \Delta \mathbf{v}_2 - \Delta \mathbf{v}_1 & x/t < \lambda_3 \\ \mathbf{v}_L + \Delta \mathbf{v}_3 = \mathbf{v}_R - \Delta \mathbf{v}_2 - \Delta \mathbf{v}_1 & \lambda_3 < x/t < \lambda_2 \\ \mathbf{v}_L + \Delta \mathbf{v}_3 + \Delta \mathbf{v}_2 = \mathbf{v}_R - \Delta \mathbf{v}_1 & \lambda_2 < x/t < \lambda_1 \\ \mathbf{v}_L + \Delta \mathbf{v}_3 + \Delta \mathbf{v}_2 + \Delta \mathbf{v}_1 = \mathbf{v}_R & \lambda_1 < x/t \end{cases}$$

## The Riemann problem in the linear case - III

or using the transformation  $\mathbf{q} = \mathbf{R}\mathbf{v}$  and  $\mathbf{R}\Delta\mathbf{v}_m = r_m\Delta v_m$

$$\mathbf{q}\left(\frac{x}{t}\right) = \begin{cases} \mathbf{q}_L = \mathbf{q}_R - \mathbf{r}_3\Delta v_3 - \mathbf{r}_2\Delta v_2 - \mathbf{r}_1\Delta v_1 & x/t < \lambda_3 \\ \mathbf{q}_L + \mathbf{r}_3\Delta v_3 = \mathbf{q}_R - \mathbf{r}_2\Delta v_2 - \mathbf{r}_1\Delta v_1 & \lambda_3 < x/t < \lambda_2 \\ \mathbf{q}_L + \mathbf{r}_3\Delta v_3 + \mathbf{r}_2\Delta v_2 = \mathbf{q}_R - \mathbf{r}_1\Delta v_1 & \lambda_2 < x/t < \lambda_1 \\ \mathbf{q}_L + \mathbf{r}_3\Delta v_3 + \mathbf{r}_2\Delta v_2 + \mathbf{r}_1\Delta v_1 = \mathbf{q}_R & \lambda_1 < x/t \end{cases}$$

Multiplying with  $\mathbf{A}$  and using  $\mathbf{A}\mathbf{r}_m = \lambda_m\mathbf{r}_m$  gives

$$\mathbf{A}\mathbf{q}\left(\frac{x}{t}\right) = \begin{cases} \mathbf{A}\mathbf{q}_L = \mathbf{A}\mathbf{q}_R - \mathbf{r}_3\lambda_3\Delta v_3 - \mathbf{r}_2\lambda_2\Delta v_2 - \mathbf{r}_1\lambda_1\Delta v_1 & x/t < \lambda_3 \\ \mathbf{A}\mathbf{q}_L + \mathbf{r}_3\lambda_3\Delta v_3 = \mathbf{A}\mathbf{q}_R - \mathbf{r}_2\lambda_2\Delta v_2 - \mathbf{r}_1\lambda_1\Delta v_1 & \lambda_3 < x/t < \lambda_2 \\ \mathbf{A}\mathbf{q}_L + \mathbf{r}_3\lambda_3\Delta v_3 + \mathbf{r}_2\lambda_2\Delta v_2 = \mathbf{A}\mathbf{q}_R - \mathbf{r}_1\lambda_1\Delta v_1 & \lambda_2 < x/t < \lambda_1 \\ \mathbf{A}\mathbf{q}_L + \mathbf{r}_3\lambda_3\Delta v_3 + \mathbf{r}_2\lambda_2\Delta v_2 + \mathbf{r}_1\lambda_1\Delta v_1 = \mathbf{A}\mathbf{q}_R & \lambda_1 < x/t \end{cases}$$

This allows direct evaluation of the flux at  $x=0$ .

$$\mathbf{F}(\mathbf{q}_L, \mathbf{q}_R) := \mathbf{f}(\mathbf{q}(0, t)) = \mathbf{A}\mathbf{q}(0, t)$$

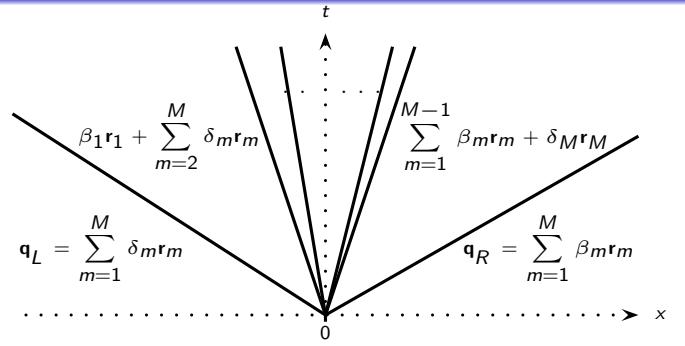

# Linear upwind schemes

Consider Riemann problem

$$\frac{\partial}{\partial t} \mathbf{q}(x, t) + \mathbf{A} \frac{\partial}{\partial x} \mathbf{q}(x, t) = \mathbf{0}, \quad x \in \mathbb{R}, \quad t > 0$$

Has exact solution

$$\mathbf{q}(x, t) = \mathbf{q}_L + \sum_{\lambda_m < x/t} a_m \mathbf{r}_m = \mathbf{q}_R - \sum_{\lambda_m \geq x/t} a_m \mathbf{r}_m = \sum_{\lambda_m \geq x/t} \delta_m \mathbf{r}_m + \sum_{\lambda_m < x/t} \beta_m \mathbf{r}_m$$

Use Riemann problem to evaluate numerical flux  $\mathbf{F}(\mathbf{q}_L, \mathbf{q}_R) := \mathbf{f}(\mathbf{q}(0, t)) = \mathbf{A}\mathbf{q}(0, t)$  as

$$\mathbf{F}(\mathbf{q}_L, \mathbf{q}_R) = \mathbf{A}\mathbf{q}_L + \sum_{\lambda_m < 0} a_m \lambda_m \mathbf{r}_m = \mathbf{A}\mathbf{q}_R - \sum_{\lambda_m \geq 0} a_m \lambda_m \mathbf{r}_m = \sum_{\lambda_m \geq 0} \delta_m \lambda_m \mathbf{r}_m + \sum_{\lambda_m < 0} \beta_m \lambda_m \mathbf{r}_m$$

Use  $\lambda_m^+ = \max(\lambda_m, 0)$ ,  $\lambda_m^- = \min(\lambda_m, 0)$

to define  $\Lambda^+ := \text{diag}(\lambda_1^+, \dots, \lambda_M^+)$ ,  $\Lambda^- := \text{diag}(\lambda_1^-, \dots, \lambda_M^-)$

and  $\mathbf{A}^+ := \mathbf{R} \Lambda^+ \mathbf{R}^{-1}$ ,  $\mathbf{A}^- := \mathbf{R} \Lambda^- \mathbf{R}^{-1}$  which gives

$$\mathbf{F}(\mathbf{q}_L, \mathbf{q}_R) = \mathbf{A}\mathbf{q}_L + \mathbf{A}^- \Delta \mathbf{q} = \mathbf{A}\mathbf{q}_R - \mathbf{A}^+ \Delta \mathbf{q} = \mathbf{A}^+ \mathbf{q}_L + \mathbf{A}^- \mathbf{q}_R$$

with  $\Delta \mathbf{q} = \mathbf{q}_R - \mathbf{q}_L$

## Flux difference splitting

Godunov-type scheme with  $\Delta \mathbf{Q}_{j+1/2}^n = \mathbf{Q}_{j+1}^n - \mathbf{Q}_j^n$

$$\mathbf{Q}_j^{n+1} = \mathbf{Q}_j^n - \frac{\Delta t}{\Delta x} \left( \mathbf{A}^- \Delta \mathbf{Q}_{j+1/2}^n + \mathbf{A}^+ \Delta \mathbf{Q}_{j-1/2}^n \right)$$

Use linearization  $\bar{\mathbf{f}}(\bar{\mathbf{q}}) = \hat{\mathbf{A}}(\mathbf{q}_L, \mathbf{q}_R)\bar{\mathbf{q}}$  and construct scheme for nonlinear problem as

$$\mathbf{Q}_j^{n+1} = \mathbf{Q}_j^n - \frac{\Delta t}{\Delta x} \left( \hat{\mathbf{A}}^-(\mathbf{Q}_j^n, \mathbf{Q}_{j+1}^n) \Delta \mathbf{Q}_{j+\frac{1}{2}}^n + \hat{\mathbf{A}}^+(\mathbf{Q}_{j-1}^n, \mathbf{Q}_j^n) \Delta \mathbf{Q}_{j-\frac{1}{2}}^n \right)$$

stability condition

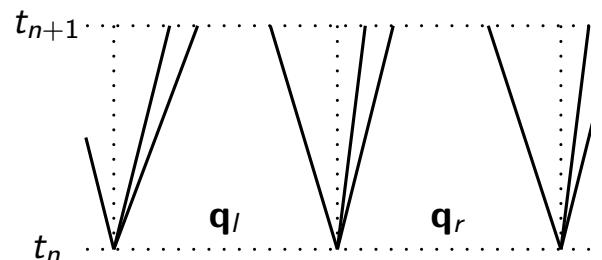

$$\max_{j \in \mathbb{Z}} |\hat{\lambda}_{m,j+\frac{1}{2}}| \frac{\Delta t}{\Delta x} \leq 1 , \quad \text{for all } m = 1, \dots, M$$

[LeVeque, 1992]

## Roe's approximate Riemann solver

Choosing  $\hat{\mathbf{A}}(\mathbf{q}_L, \mathbf{q}_R)$  [Roe, 1981]:

- (i)  $\hat{\mathbf{A}}(\mathbf{q}_L, \mathbf{q}_R)$  has real eigenvalues
- (ii)  $\hat{\mathbf{A}}(\mathbf{q}_L, \mathbf{q}_R) \rightarrow \frac{\partial \mathbf{f}(\mathbf{q})}{\partial \mathbf{q}}$  as  $\mathbf{q}_L, \mathbf{q}_R \rightarrow \mathbf{q}$
- (iii)  $\hat{\mathbf{A}}(\mathbf{q}_L, \mathbf{q}_R)\Delta\mathbf{q} = \mathbf{f}(\mathbf{q}_R) - \mathbf{f}(\mathbf{q}_L)$

Wave decomposition:  $\Delta\mathbf{q} = \mathbf{q}_r - \mathbf{q}_L = \sum_m a_m \hat{\mathbf{r}}_m$

$$\begin{aligned} \mathbf{F}(\mathbf{q}_L, \mathbf{q}_R) &= \mathbf{f}(\mathbf{q}_L) + \sum_{\hat{\lambda}_m < 0} \hat{\lambda}_m a_m \hat{\mathbf{r}}_m = \mathbf{f}(\mathbf{q}_R) - \sum_{\hat{\lambda}_m \geq 0} \hat{\lambda}_m a_m \hat{\mathbf{r}}_m \\ &= \frac{1}{2} \left( \mathbf{f}(\mathbf{q}_L) + \mathbf{f}(\mathbf{q}_R) - \sum_m |\hat{\lambda}_m| a_m \hat{\mathbf{r}}_m \right) \end{aligned}$$

# The Roe solver for Euler equations

For Euler equations, the following non-apparent average defines the Roe method:  
The average for  $u$  and  $H$  read

$$\hat{u} := \frac{\sqrt{\rho_L} u_L + \sqrt{\rho_R} u_R}{\sqrt{\rho_L} + \sqrt{\rho_R}}, \quad \hat{H} := \frac{\sqrt{\rho_L} H_L + \sqrt{\rho_R} H_R}{\sqrt{\rho_L} + \sqrt{\rho_R}}$$

The average of the density is

$$\hat{\rho} = \frac{\sqrt{\rho_L} \rho_R + \sqrt{\rho_R} \rho_L}{\sqrt{\rho_L} + \sqrt{\rho_R}} = \sqrt{\rho_L \rho_R}$$

and the averaged speed of sound is

$$\hat{a} := \left( (\gamma - 1)(\hat{H} - \frac{1}{2}\hat{u}^2) \right)^{1/2}$$

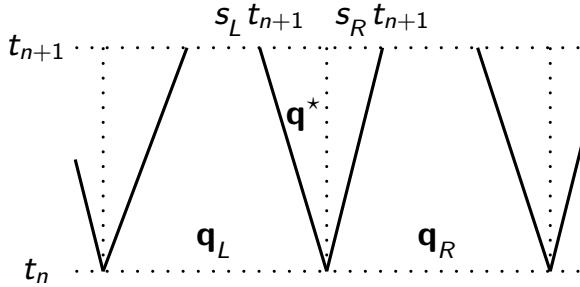

The eigenvectors read

$$\hat{r}_1 = \begin{bmatrix} 1 \\ \hat{u} - \hat{a} \\ \hat{H} - \hat{u}\hat{a} \end{bmatrix}, \quad \hat{r}_2 = \begin{bmatrix} 1 \\ \hat{u} \\ \hat{u}^2/2 \end{bmatrix}, \quad \hat{r}_3 = \begin{bmatrix} 1 \\ \hat{u} + \hat{a} \\ \hat{H} + \hat{u}\hat{a} \end{bmatrix}$$

and the characteristic wave strengths are

$$\Delta v_1 = a_1 = \frac{\Delta p - \hat{\rho}\hat{a}\Delta u}{2\hat{a}^2}, \quad \Delta v_2 = a_2 = \Delta\rho - \frac{\Delta p}{\hat{a}^2}, \quad \Delta v_3 = a_3 = \frac{\Delta p + \hat{\rho}\hat{a}\Delta u}{2\hat{a}^2}.$$

# Harten-Lax-Van Leer (HLL) approximate Riemann solver

$$\bar{q}(x, t) = \begin{cases} q_L, & x < s_L t \\ q^*, & s_L t \leq x \leq s_R t \\ q_R, & x > s_R t \end{cases}$$

$$F_{HLL}(q_L, q_R) = \begin{cases} f(q_L), & 0 < s_L, \\ \frac{s_R f(q_L) - s_L f(q_R) + s_L s_R (q_R - q_L)}{s_R - s_L}, & s_L \leq 0 \leq s_R, \\ f(q_R), & 0 > s_R, \end{cases}$$

Euler equations:

$$s_L = \min(u_{1,L} - c_L, u_{1,R} - c_R), \quad s_R = \max(u_{1,L} + c_L, u_{1,R} + c_R)$$

[Toro, 1999], HLLC: [Toro et al., 1994]

## Flux-vector splitting

### Splitting

$$\mathbf{f}(\mathbf{q}) = \mathbf{f}^+(\mathbf{q}) + \mathbf{f}^-(\mathbf{q})$$

derived under restriction  $\hat{\lambda}_m^+ \geq 0$  and  $\hat{\lambda}_m^- \leq 0$  for all  $m = 1, \dots, M$  for

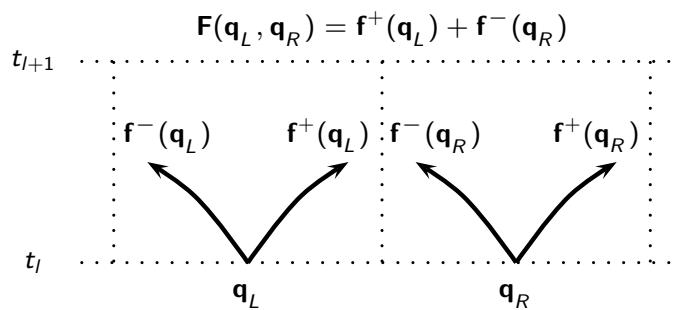

$$\hat{\mathbf{A}}^+(\mathbf{q}) = \frac{\partial \mathbf{f}^+(\mathbf{q})}{\partial \mathbf{q}}, \quad \hat{\mathbf{A}}^-(\mathbf{q}) = \frac{\partial \mathbf{f}^-(\mathbf{q})}{\partial \mathbf{q}}$$

plus reproduction of regular upwinding

$$\begin{aligned} \mathbf{f}^+(\mathbf{q}) &= \mathbf{f}(\mathbf{q}), & \mathbf{f}^-(\mathbf{q}) &= \mathbf{0} & \text{if } \lambda_m \geq 0 & \text{for all } m = 1, \dots, M \\ \mathbf{f}^+(\mathbf{q}) &= \mathbf{0}, & \mathbf{f}^-(\mathbf{q}) &= \mathbf{f}(\mathbf{q}) & \text{if } \lambda_m \leq 0 & \text{for all } m = 1, \dots, M \end{aligned}$$

Then use

$$\mathbf{F}(\mathbf{q}_L, \mathbf{q}_R) = \mathbf{f}^+(\mathbf{q}_L) + \mathbf{f}^-(\mathbf{q}_R)$$

# Steger-Warming

Required  $\mathbf{f}(\mathbf{q}) = \mathbf{A}(\mathbf{q}) \mathbf{q}$

$$\lambda_m^+ = \frac{1}{2} (\lambda_m + |\lambda_m|) \quad \lambda_m^- = \frac{1}{2} (\lambda_m - |\lambda_m|)$$

$$\mathbf{A}^+(\mathbf{q}) := \mathbf{R}(\mathbf{q}) \mathbf{\Lambda}^+(\mathbf{q}) \mathbf{R}^{-1}(\mathbf{q}), \quad \mathbf{A}^-(\mathbf{q}) := \mathbf{R}(\mathbf{q}) \mathbf{\Lambda}^-(\mathbf{q}) \mathbf{R}^{-1}(\mathbf{q})$$

Gives

$$\mathbf{f}(\mathbf{q}) = \mathbf{A}^+(\mathbf{q}) \mathbf{q} + \mathbf{A}^-(\mathbf{q}) \mathbf{q}$$

and the numerical flux

$$\mathbf{F}(\mathbf{q}_L, \mathbf{q}_R) = \mathbf{A}^+(\mathbf{q}_L) \mathbf{q}_L + \mathbf{A}^-(\mathbf{q}_R) \mathbf{q}_R$$

Jacobians of the split fluxes are identical to  $\mathbf{A}^\pm(\mathbf{q})$  only in linear case

$$\frac{\partial \mathbf{f}^\pm(\mathbf{q})}{\partial \mathbf{q}} = \frac{\partial (\mathbf{A}^\pm(\mathbf{q}) \mathbf{q})}{\partial \mathbf{q}} = \mathbf{A}^\pm(\mathbf{q}) + \frac{\partial \mathbf{A}^\pm(\mathbf{q})}{\partial \mathbf{q}} \mathbf{q}$$

Further methods: Van Leer FVS [Toro, 1999], AUSM [Wada and Liou, 1997]

## Steger-Warming FVS for Euler equations

For Euler equations,  $\mathbf{f}(\mathbf{q}) = \mathbf{A}(\mathbf{q}) \mathbf{q}$  holds true. We also know all matrices  $\mathbf{R}^{-1} \mathbf{A} \mathbf{R} = \mathbf{\Lambda}$ .

**Approach 1:** Introduce  $\lambda_m^+ = \frac{1}{2} (\lambda_m + |\lambda_m|)$ ,  $\lambda_m^- = \frac{1}{2} (\lambda_m - |\lambda_m|)$  and compute  $\mathbf{A}^+$  and  $\mathbf{A}^-$  directly.

**Approach 2:** Analyze sign of eigenvalues:

$u < -a$  : All eigenvalues are negative:  $u - a < u < u + a < 0$

$$\mathbf{f}^-(\mathbf{q}) = [\rho u, \rho u^2 + p, \rho u H]^T, \quad \mathbf{f}^+(\mathbf{q}) = 0$$

$u > a$  : All eigenvalues are positive:  $0 < u - a < u < u + a$

$$\mathbf{f}^-(\mathbf{q}) = 0, \quad \mathbf{f}^+(\mathbf{q}) = [\rho u, \rho u^2 + p, \rho u H]^T$$

$-a \leq u \leq a$  : We find  $u - a \leq 0$  and  $u + a \geq 0$  are always satisfied. For  $u < 0$ , we need to evaluate

$$\mathbf{f}^-(\mathbf{q}) = \mathbf{R} \begin{bmatrix} u - a & 0 & 0 \\ 0 & u & 0 \\ 0 & 0 & 0 \end{bmatrix} \mathbf{R}^{-1} \mathbf{q}, \quad \mathbf{f}^+(\mathbf{q}) = \mathbf{R} \begin{bmatrix} 0 & 0 & 0 \\ 0 & 0 & 0 \\ 0 & 0 & u + a \end{bmatrix} \mathbf{R}^{-1} \mathbf{q}$$

For  $u \geq 0$ , we need to evaluate

$$\mathbf{f}^-(\mathbf{q}) = \mathbf{R} \begin{bmatrix} u - a & 0 & 0 \\ 0 & 0 & 0 \\ 0 & 0 & 0 \end{bmatrix} \mathbf{R}^{-1} \mathbf{q}, \quad \mathbf{f}^+(\mathbf{q}) = \mathbf{R} \begin{bmatrix} 0 & 0 & 0 \\ 0 & u & 0 \\ 0 & 0 & u + a \end{bmatrix} \mathbf{R}^{-1} \mathbf{q}$$

## Structured adaptive mesh refinement

Course *Block-structured Adaptive Finite Volume Methods in C++*

Ralf Deiterding

University of Southampton  
Engineering and the Environment  
Highfield Campus, Southampton SO17 1BJ, UK

E-mail: r.deiterding@soton.ac.uk

# Outline

## Meshes and adaptation

- Adaptivity on unstructured and structured meshes
- Available SAMR software

## The serial Berger-Colella SAMR method

- Data structures and numerical update
- Conservative flux correction
- Level transfer operators
- The basic recursive algorithm
- Block generation and flagging of cells

## Parallel SAMR method

- Domain decomposition
- A parallel SAMR algorithm

# Outline

## Meshes and adaptation

- Adaptivity on unstructured and structured meshes
- Available SAMR software

## The serial Berger-Colella SAMR method

- Data structures and numerical update
- Conservative flux correction
- Level transfer operators
- The basic recursive algorithm
- Block generation and flagging of cells

## Parallel SAMR method

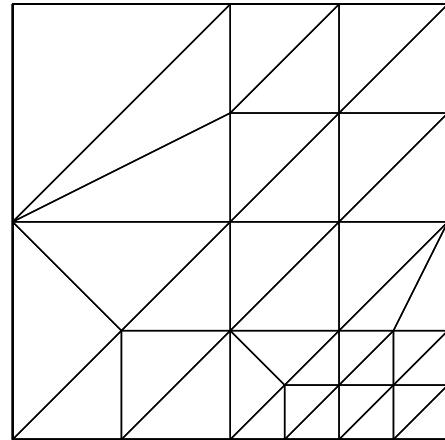

- Domain decomposition
- A parallel SAMR algorithm

# Elements of adaptive algorithms

- ▶ Base grid
- ▶ Solver
- ▶ Error indicators
- ▶ Grid manipulation
- ▶ Interpolation (restriction and prolongation)
- ▶ Load-balancing

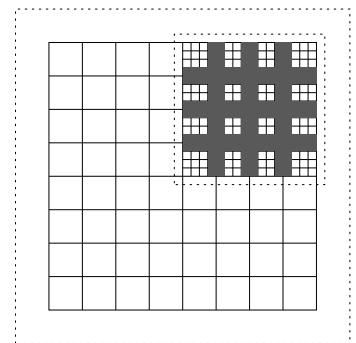

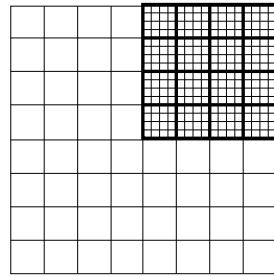

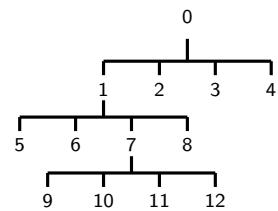

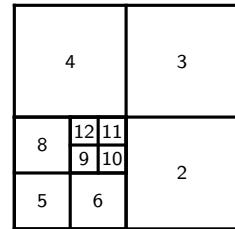

## Adaptivity on unstructured meshes

- ▶ Coarse cells replaced by finer ones
  - ▶ Global time-step
  - ▶ Cell-based data structures
  - ▶ Neighborhoods have to stored
  - + Geometric flexible
  - + No hanging nodes
  - + Easy to implement
  - Higher order difficult to achieve
  - Cell aspect ratio must be considered
  - Fragmented data
  - Cache-reuse / vectorizaton nearly impossible
  - Complex load-balancing
  - Complex synchronization

# Structured mesh refinement techniques

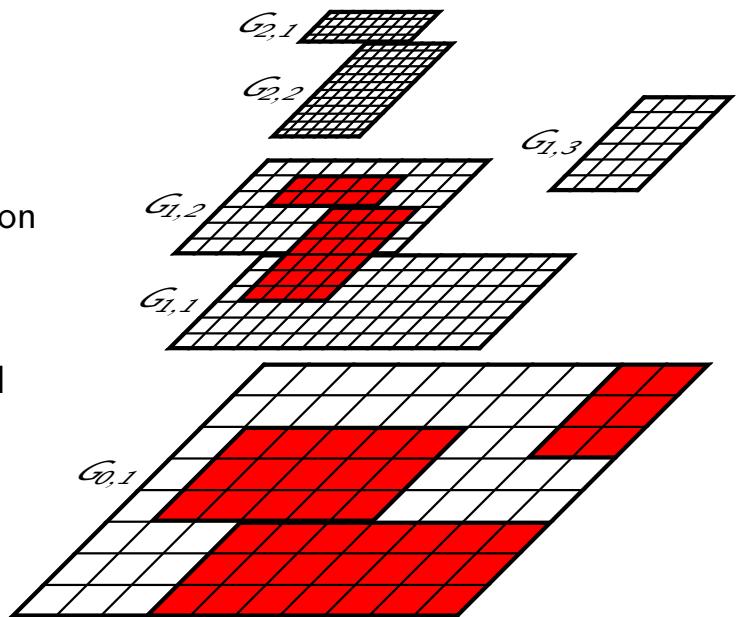

- ▶ Block-based data of equal size
  - ▶ Block stored in a quad-tree
  - ▶ Time-step refinement
  - ▶ Global index coordinate system
  - ▶ Neighborhoods need not be stored
  - + Numerical scheme only for single regular block necessary
  - + Easy to implement
  - + Simple load-balancing
  - + Parent/Child relations according to tree
  - +/- Cache-reuse / vectorization only in data block

## Wasted boundary space in a quad-tree

# Block-structured adaptive mesh refinement (SAMR)

- ▶ Refined block overlay coarser ones
  - ▶ Time-step refinement
  - ▶ Block (aka patch) based data structures
  - ▶ Global index coordinate system
  - + Numerical scheme only for single patch necessary
  - + Efficient cache-reuse / vectorization possible
  - + Simple load-balancing
  - + Minimal synchronization overhead
  - Cells without mark are refined
  - Hanging nodes unavoidable
  - Cluster-algorithm necessary
  - Difficult to implement

# Simplified structured designs

*Distributed memory parallelization fully supported if not otherwise states.*

- ▶ PARAMESH (Parallel Adaptive Mesh Refinement)
    - ▶ Library based on uniform refinement blocks [MacNeice et al., 2000]
    - ▶ Both multigrid and explicit algorithms considered
    - ▶ <http://sourceforge.net/projects/paramesh>
  - ▶ Flash code (AMR code for astrophysical thermonuclear flashes)
    - ▶ Built on PARAMESH
    - ▶ Solves the magneto-hydrodynamic equations with self-gravitation
    - ▶ <http://www.flash.uchicago.edu/site/flashcode>
  - ▶ Uintah (AMR code for simulation of accidental fires and explosions)
    - ▶ Only explicit algorithms considered
    - ▶ FSI coupling Material Point Method and ICE Method (Implicit, Continuous fluid, Eulerian)
    - ▶ <http://www.uintah.utah.edu>
  - ▶ DAGH/Grace [Parashar and Browne, 1997]
    - ▶ Just C++ data structures but no methods
    - ▶ All grids are aligned to bases mesh coarsened by factor 2
    - ▶ <http://userweb.cs.utexas.edu/users/dagh>

# Systems that support general SAMR

- ▶ SAMRAI - Structured Adaptive Mesh Refinement Application Infrastructure
  - ▶ Very mature SAMR system [Hornung et al., 2006]
  - ▶ Explicit algorithms directly supported, implicit methods through interface to Hypre package
  - ▶ Mapped geometry and some embedded boundary support
  - ▶ <https://computation-rnd.llnl.gov/SAMRAI/software.php>
- ▶ BoxLib, AmrLib, MGLib, HGProj
  - ▶ Berkley-Lab-AMR collection of C++ classes by J. Bell et al., 50,000 LOC [Rendleman et al., 2000]
  - ▶ Both multigrid and explicit algorithms supported
  - ▶ <https://ccse.llnl.gov/Downloads/index.html>
- ▶ Chombo
  - ▶ Redesign and extension of BoxLib by P. Colella et al.
  - ▶ Both multigrid and explicit algorithms demonstrated
  - ▶ Some embedded boundary support
  - ▶ <https://commons.llnl.gov/display/chombo>

# Further SAMR software

- ▶ Overture (Object-oriented tools for solving PDEs in complex geometries)
  - ▶ Overlapping meshes for complex geometries by W. Henshaw et al.  
[Brown et al., 1997]
  - ▶ Explicit and implicit algorithms supported
  - ▶ <http://www.overtureframework.org>
- ▶ AMRClaw within Clawpack [Berger and LeVeque, 1998]
  - ▶ Serial 2D Fortran 77 code for the explicit Wave Propagation method with own memory management
  - ▶ <http://depts.washington.edu/clawpack>
- ▶ Amrita by J. Quirk
  - ▶ Only 2D explicit finite volume methods supported
  - ▶ Embedded boundary algorithm
  - ▶ <http://www.amrita-cfd.org>
- ▶ Cell-based Cartesian AMR: RAGE
  - ▶ Embedded boundary method
  - ▶ Explicit and implicit algorithms
  - ▶ [Gittings et al., 2008]

# Outline

## Meshes and adaptation

- Adaptivity on unstructured and structured meshes
- Available SAMR software

## The serial Berger-Colella SAMR method

- Data structures and numerical update
- Conservative flux correction
- Level transfer operators
- The basic recursive algorithm
- Block generation and flagging of cells

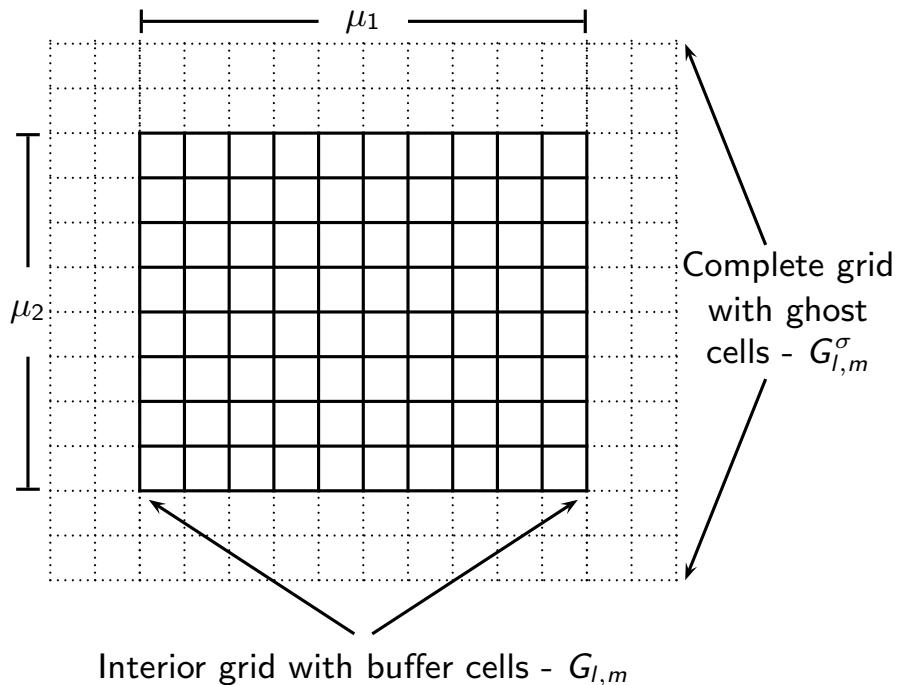

## Parallel SAMR method

- Domain decomposition
- A parallel SAMR algorithm

# The $m$ th refinement grid on level $l$

Notations:

- ▶ Boundary:  $\partial G_{l,m}$
- ▶ Hull:  $\bar{G}_{l,m} = G_{l,m} \cup \partial G_{l,m}$
- ▶ Ghost cell region:  $\tilde{G}_{l,m}^\sigma = G_{l,m}^\sigma \setminus \bar{G}_{l,m}$

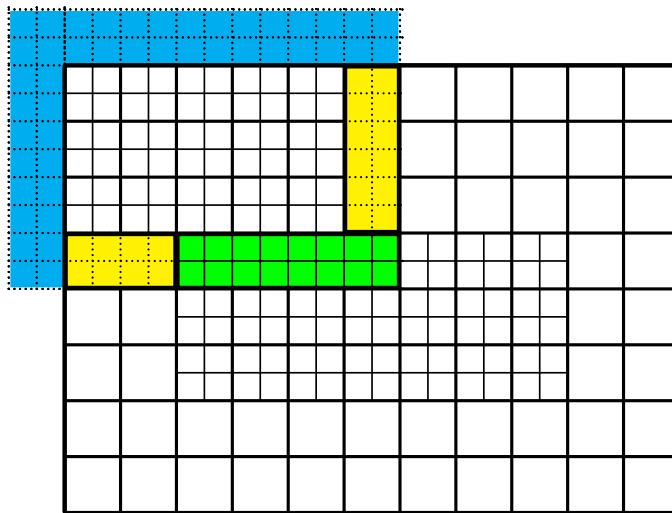

## Refinement data

- ▶ Resolution:  $\Delta t_l := \frac{\Delta t_{l-1}}{r_l}$  and  $\Delta x_{n,l} := \frac{\Delta x_{n,l-1}}{r_l}$
  - ▶ Refinement factor:  $r_l \in \mathbb{N}$ ,  $r_l \geq 2$  for  $l > 0$  and  $r_0 = 1$
  - ▶ Integer coordinate system for internal organization [Bell et al., 1994]:

$$\Delta x_{n,I} \cong \prod_{\kappa=I+1}^{l_{\max}} r_\kappa$$

- ▶ Computational Domain:  $G_0 = \bigcup_{m=1}^{M_0} G_{0,m}$
  - ▶ Domain of level  $I$ :  $G_I := \bigcup_{m=1}^{M_I} G_{I,m}$  with  $G_{I,m} \cap G_{I,n} = \emptyset$  for  $m \neq n$
  - ▶ Refinements are properly nested:  $G_I^1 \subset G_{I-1}$
  - ▶ Assume a FD scheme with stencil radius  $s$ . Necessary data:
    - ▶ Vector of state:  $\mathbf{Q}^I := \bigcup_m \mathbf{Q}(G_{I,m}^s)$
    - ▶ Numerical fluxes:  $\mathbf{F}^{n,I} := \bigcup_m \mathbf{F}^n(\bar{G}_{I,m})$
    - ▶ Flux corrections:  $\delta\mathbf{F}^{n,I} := \bigcup_m \delta\mathbf{F}^n(\partial G_{I,m})$

# Setting of ghost cells

- Synchronization with  $G_I - \tilde{S}_{I,m}^s = \tilde{G}_{I,m}^s \cap G_I$
  - Physical boundary conditions -  $\tilde{P}_{I,m}^s = \tilde{G}_{I,m}^s \setminus G_0$
  - Interpolation from  $G_{I-1}$  -  $\tilde{I}_{I,m}^s = \tilde{G}_{I,m}^s \setminus (\tilde{S}_{I,m}^s \cup \tilde{P}_{I,m}^s)$

## Numerical update

Time-explicit conservative finite volume scheme

$$\mathcal{H}^{(\Delta t)} : \mathbf{Q}_{jk}(t+\Delta t) = \mathbf{Q}_{jk}(t) - \frac{\Delta t}{\Delta x_1} \left( \mathbf{F}_{j+\frac{1}{2},k}^1 - \mathbf{F}_{j-\frac{1}{2},k}^1 \right) - \frac{\Delta t}{\Delta x_2} \left( \mathbf{F}_{j,k+\frac{1}{2}}^2 - \mathbf{F}_{j,k-\frac{1}{2}}^2 \right)$$

`UpdateLevel()`

For all  $m = 1$  To  $M_I$  Do

$$\mathbf{Q}(G_{l,m}^s, t) \xrightarrow{\mathcal{H}^{(\Delta t_l)}} \mathbf{Q}(G_{l,m}, t + \Delta t_l), \mathbf{F}^n(\bar{G}_{l,m}, t)$$

If level  $l > 0$

Add  $\mathbf{F}^n(\partial G_{l,m}, t)$  to  $\delta\mathbf{F}^{n,l}$

If level  $l+1$  exists

Init  $\delta\mathbf{F}^{n,I+1}$  with  $\mathbf{F}^n(\bar{G}_{I,m} \cap \partial G_{I+1}, t)$

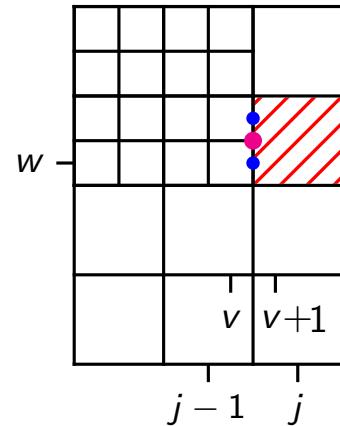

# Conservative flux correction

Example: Cell  $j, k$

$$\begin{aligned}\check{\mathbf{Q}}'_{jk}(t + \Delta t_l) &= \mathbf{Q}'_{jk}(t) - \frac{\Delta t_l}{\Delta x_{1,l}} \left( \mathbf{F}_{j+\frac{1}{2},k}^{1,l} - \frac{1}{r_{l+1}^2} \sum_{\kappa=0}^{r_{l+1}-1} \sum_{\iota=0}^{r_{l+1}-1} \mathbf{F}_{v+\frac{1}{2},w+\iota}^{1,l+1}(t + \kappa \Delta t_{l+1}) \right) \\ &\quad - \frac{\Delta t_l}{\Delta x_{2,l}} \left( \mathbf{F}_{j,k+\frac{1}{2}}^{2,l} - \mathbf{F}_{j,k-\frac{1}{2}}^{2,l} \right)\end{aligned}$$

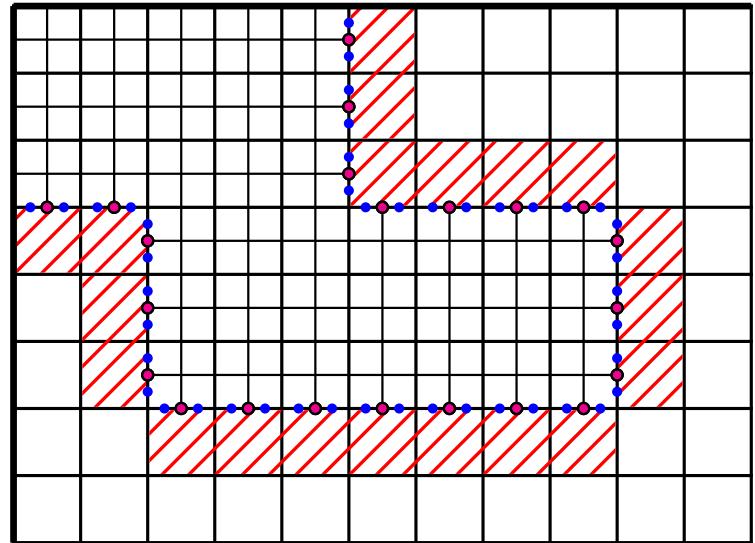

Correction pass:

1.  $\delta\mathbf{F}_{j-\frac{1}{2},k}^{1,l+1} := -\mathbf{F}_{j-\frac{1}{2},k}^{1,l}$
2.  $\delta\mathbf{F}_{j-\frac{1}{2},k}^{1,l+1} := \delta\mathbf{F}_{j-\frac{1}{2},k}^{1,l+1} + \frac{1}{r_{l+1}^2} \sum_{\iota=0}^{r_{l+1}-1} \mathbf{F}_{v+\frac{1}{2},w+\iota}^{1,l+1}(t + \kappa \Delta t_{l+1})$
3.  $\check{\mathbf{Q}}'_{jk}(t + \Delta t_l) := \mathbf{Q}'_{jk}(t + \Delta t_l) + \frac{\Delta t_l}{\Delta x_{1,l}} \delta\mathbf{F}_{j-\frac{1}{2},k}^{1,l+1}$

# Conservative flux correction II

- ▶ Level  $l$  cells needing correction  $(G_{l+1}^{r_{l+1}} \setminus G_{l+1}) \cap G_l$
- ▶ Corrections  $\delta\mathbf{F}^{n,l+1}$  stored on level  $l+1$  along  $\partial G_{l+1}$  (lower-dimensional data coarsened by  $r_{l+1}$ )
- ▶ Init  $\delta\mathbf{F}^{n,l+1}$  with level  $l$  fluxes  $\mathbf{F}^{n,l}(\bar{G}_l \cap \partial G_{l+1})$
- ▶ Add level  $l+1$  fluxes  $\mathbf{F}^{n,l+1}(\partial G_{l+1})$  to  $\delta\mathbf{F}^{n,l}$

■ Cells to correct    •  $\mathbf{F}^{n,l}$     •  $\mathbf{F}^{n,l+1}$     o  $\delta\mathbf{F}^{n,l+1}$

# Level transfer operators

Conservative averaging (restriction):

Replace cells on level  $l$  covered by level  $l + 1$ , i.e.

$G_I \cap G_{I+1}$ , by

$$\hat{\mathbf{Q}}_{jk}^l := \frac{1}{(r_{l+1})^2} \sum_{\kappa=0}^{r_{l+1}-1} \sum_{\iota=0}^{r_{l+1}-1} \mathbf{Q}_{v+\kappa, w+\iota}^{l+1}$$

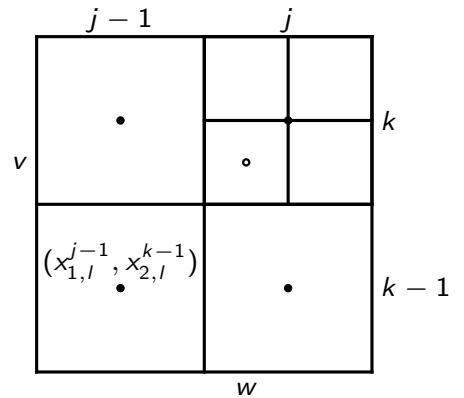

Bilinear interpolation (prolongation):

$$\begin{aligned}\check{\mathbf{Q}}_{vw}^{l+1} := & (1-f_1)(1-f_2) \mathbf{Q}_{j-1,k-1}^l + f_1(1-f_2) \mathbf{Q}_{j,k-1}^l + \\ & (1-f_1)f_2 \mathbf{Q}_{j-1,k}^l + f_1f_2 \mathbf{Q}_{jk}^l\end{aligned}$$

with factors  $f_1 := \frac{x_{1,l+1}^v - x_{1,l}^{j-1}}{\Delta x_{1,l}}$ ,  $f_2 := \frac{x_{2,l+1}^w - x_{2,l}^{k-1}}{\Delta x_{2,l}}$  derived from the spatial coordinates of the cell centers  $(x_{1,l}^{j-1}, x_{2,l}^{k-1})$  and  $(x_{1,l+1}^v, x_{2,l+1}^w)$ .

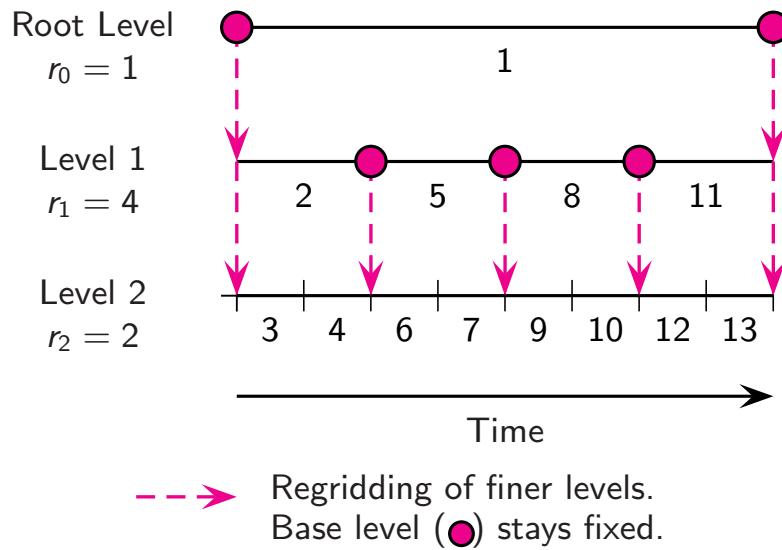

For boundary conditions on  $\tilde{I}_j^s$ : linear time interpolation

$$\tilde{\mathbf{Q}}'^{+1}(t + \kappa \Delta t_{l+1}) := \left(1 - \frac{\kappa}{r_{l+1}}\right) \check{\mathbf{Q}}'^{+1}(t) + \frac{\kappa}{r_{l+1}} \check{\mathbf{Q}}'^{+1}(t + \Delta t_l) \quad \text{for } \kappa = 0, \dots, r_{l+1}$$

# Recursive integration order

- ▶ Space-time interpolation of coarse data to set  $I_l^s, l > 0$
- ▶ Regridding:
  - ▶ Creation of new grids, copy existing cells on level  $l > 0$
  - ▶ Spatial interpolation to initialize new cells on level  $l > 0$

# The basic recursive algorithm

`AdvanceLevel( $l$ )`

Repeat  $r_l$  times

  Set ghost cells of  $\mathbf{Q}^l(t)$

  If time to regrid?

`Regrid( $l$ )`

`UpdateLevel( $l$ )`

  If level  $l + 1$  exists?

    Set ghost cells of  $\mathbf{Q}^l(t + \Delta t_l)$

`AdvanceLevel( $l + 1$ )`

    Average  $\mathbf{Q}^{l+1}(t + \Delta t_l)$  onto  $\mathbf{Q}^l(t + \Delta t_l)$

    Correct  $\mathbf{Q}^l(t + \Delta t_l)$  with  $\delta\mathbf{F}^{l+1}$

$t := t + \Delta t_l$

- ▶ Recursion
- ▶ Restriction and flux correction
- ▶ Re-organization of hierarchical data

Start - Start integration on level 0

$l = 0, r_0 = 1$

`AdvanceLevel( $l$ )`

[Berger and Colella, 1988][Berger and Oliger, 1984]

# Regridding algorithm

Regrid( $l$ ) – Regrid all levels  $\iota > l$

```

For  $\iota = l_f$  Downto  $l$  Do
  Flag  $N^\iota$  according to  $\mathbf{Q}^\iota(t)$ 
  If level  $\iota + 1$  exists?
    Flag  $N^\iota$  below  $\check{G}^{\iota+2}$ 
  Flag buffer zone on  $N^\iota$ 
  Generate  $\check{G}^{\iota+1}$  from  $N^\iota$ 
 $\check{G}_l := G_l$ 
For  $\iota = l$  To  $l_f$  Do
   $C\check{G}_\iota := G_0 \setminus \check{G}_\iota$ 
   $\check{G}_{\iota+1} := \check{G}_{\iota+1} \setminus C\check{G}_\iota^1$ 

```

Recompose( $l$ )

- ▶ Refinement flags:  
 $N^l := \bigcup_m N(\partial G_{l,m})$
- ▶ Activate flags below higher levels
- ▶ Flag buffer cells of  $b > \kappa_r$  cells,  
 $\kappa_r$  steps between calls of  
 Regrid( $l$ )
- ▶ Special cluster algorithm
- ▶ Use complement operation to ensure proper nesting condition

# Recomposition of data

Recompose(/) - Reorganize all levels  $\iota > l$

For  $\iota = l + 1$  To  $l_f + 1$  Do

Interpolate  $\mathbf{Q}^{\ell-1}(t)$  onto  $\check{\mathbf{Q}}^\ell(t)$

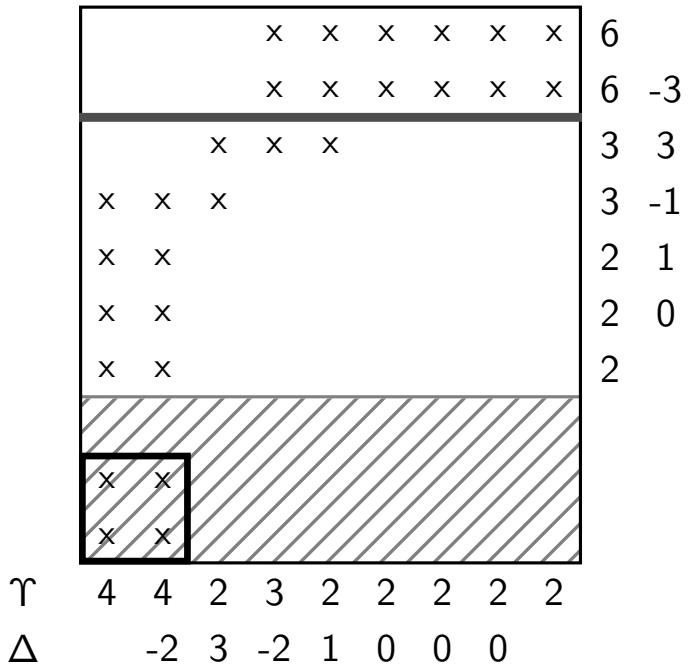

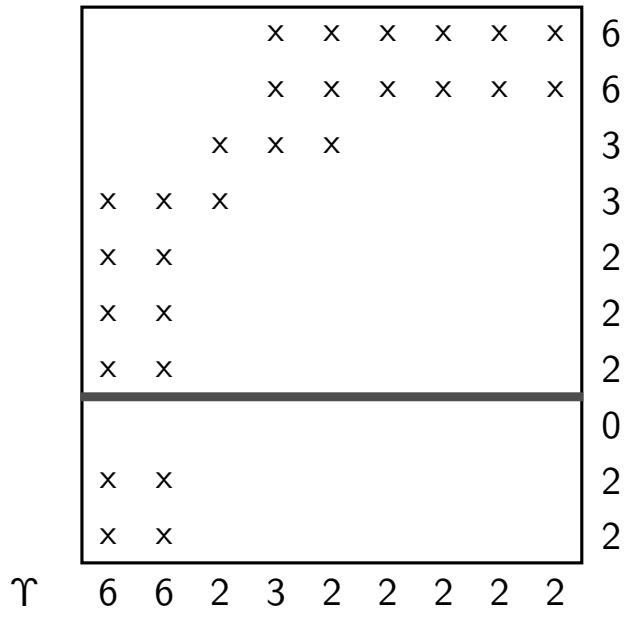

Copy  $\mathbf{Q}^\ell(t)$  onto  $\check{\mathbf{Q}}^\ell(t)$

Set ghost cells of  $\tilde{\mathbf{Q}}^\ell(t)$

$$\mathbf{Q}^\nu(t) := \check{\mathbf{Q}}^\nu(t), \quad G_\nu := \check{G}_\nu$$

- ▶ Creates max. 1 level above  $l_f$ , but can remove multiple levels if  $\check{G}_\ell$  empty (no coarsening!)
  - ▶ Use spatial interpolation on entire data  $\check{\mathbf{Q}}^\ell(t)$
  - ▶ Overwrite where old data exists
  - ▶ Synchronization and physical boundary conditions

# Clustering by signatures

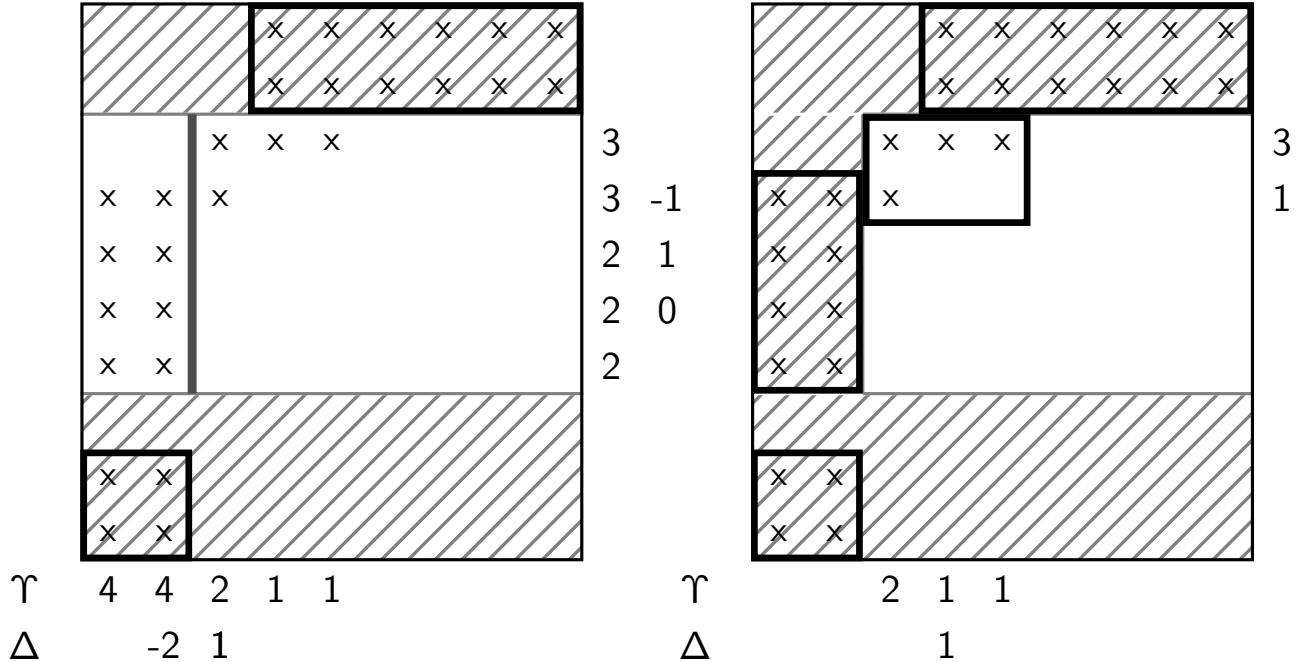

$\gamma$  Flagged cells per row/column

$\Delta$  Second derivative of  $\gamma$ ,  $\Delta = \gamma_{\nu+1} - 2\gamma_\nu + \gamma_{\nu-1}$

Technique from image detection: [Bell et al., 1994], see also

[Berger and Rigoutsos, 1991], [Berger, 1986]

Recursive generation of  $\check{G}_{l,m}$

1. 0 in  $\Upsilon$
2. Largest difference in  $\Delta$
3. Stop if ratio between flagged and unflagged cell  $> \eta_{tol}$

## Refinement criteria

Scaled gradient of scalar quantity  $w$

$$|w(\mathbf{Q}_{j+1,k}) - w(\mathbf{Q}_{jk})| > \epsilon_w, \quad |w(\mathbf{Q}_{j,k+1}) - w(\mathbf{Q}_{jk})| > \epsilon_w, \quad |w(\mathbf{Q}_{j+1,k+1}) - w(\mathbf{Q}_{jk})| > \epsilon_w$$

Heuristic error estimation [Berger, 1982]:

Local truncation error of scheme of order  $o$

$$\mathbf{q}(\mathbf{x}, t + \Delta t) - \mathcal{H}^{(\Delta t)}(\mathbf{q}(\cdot, t)) = \mathbf{C} \Delta t^{o+1} + O(\Delta t^{o+2})$$

For  $\mathbf{q}$  smooth after 2 steps  $\Delta t$

$$\mathbf{q}(\mathbf{x}, t + \Delta t) - \mathcal{H}_2^{(\Delta t)}(\mathbf{q}(\cdot, t - \Delta t)) = 2 \mathbf{C} \Delta t^{o+1} + O(\Delta t^{o+2})$$

and after 1 step with  $2\Delta t$

$$\mathbf{q}(\mathbf{x}, t + \Delta t) - \mathcal{H}^{(2\Delta t)}(\mathbf{q}(\cdot, t - \Delta t)) = 2^{o+1} \mathbf{C} \Delta t^{o+1} + O(\Delta t^{o+2})$$

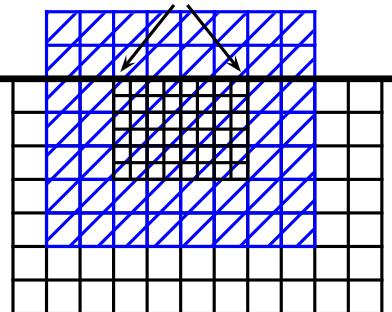

Gives

$$\mathcal{H}_2^{(\Delta t)}(\mathbf{q}(\cdot, t - \Delta t)) - \mathcal{H}^{(2\Delta t)}(\mathbf{q}(\cdot, t - \Delta t)) = (2^{o+1} - 2) \mathbf{C} \Delta t^{o+1} + O(\Delta t^{o+2})$$

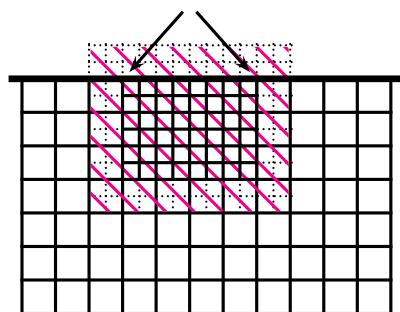

Heuristic error estimation for FV methods

2. Create temporary Grid coarsened by factor 2

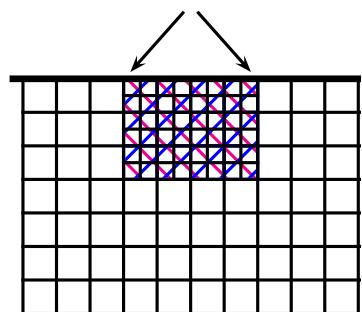

Initialize with fine-grid-values of preceding time step

## 1. Error estimation on interior cells

### 3. Compare temporary solutions

$$\begin{aligned} \mathcal{H}^{\Delta t_l} \mathbf{Q}^l(t_l - \Delta t_l) &= \mathcal{H}^{\Delta t_l} (\mathcal{H}^{\Delta t_l} \mathbf{Q}^l(t_l - \Delta t_l)) \\ &= \mathcal{H}_2^{\Delta t_l} \mathbf{Q}^l(t_l - \Delta t_l) \\ &= \mathcal{H}^{2\Delta t_l} \bar{\mathbf{Q}}^l(t_l - \Delta t_l) \end{aligned}$$

# Usage of heuristic error estimation

Current solution integrated tentatively 1 step with  $\Delta t_I$  and coarsened

$$\bar{\mathcal{Q}}(t_I + \Delta t_I) := \text{Restrict} \left( \mathcal{H}_2^{\Delta t_I} \mathbf{Q}'(t_I - \Delta t_I) \right)$$

Previous solution coarsened and integrated 1 step with  $2\Delta t_I$

$$\mathcal{Q}(t_I + \Delta t_I) := \mathcal{H}^{2\Delta t_I} \text{Restrict} \left( \mathbf{Q}'(t_I - \Delta t_I) \right)$$

Local error estimation of scalar quantity  $w$

$$\tau_{jk}^w := \frac{|w(\bar{\mathcal{Q}}_{jk}(t + \Delta t)) - w(\mathcal{Q}_{jk}(t + \Delta t))|}{2^{o+1} - 2}$$

In practice [Deiterding, 2003] use

$$\frac{\tau_{jk}^w}{\max(|w(\mathcal{Q}_{jk}(t + \Delta t))|, S_w)} > \eta_w^r$$

# Outline

## Meshes and adaptation

- Adaptivity on unstructured and structured meshes
- Available SAMR software

## The serial Berger-Colella SAMR method

- Data structures and numerical update
- Conservative flux correction
- Level transfer operators
- The basic recursive algorithm
- Block generation and flagging of cells

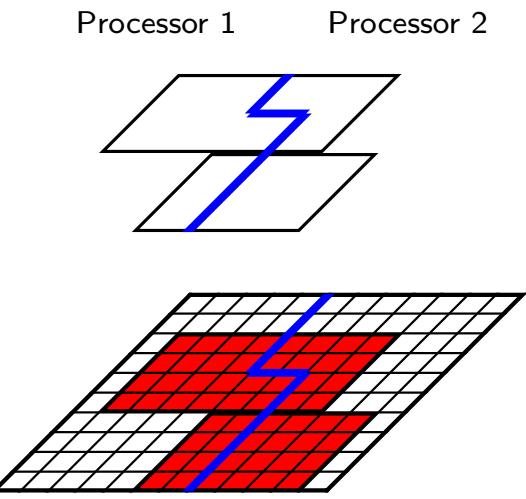

## Parallel SAMR method

- Domain decomposition
- A parallel SAMR algorithm

# Parallelization strategies

## Decomposition of the hierarchical data

- ▶ Distribution of each grid
- ▶ Separate distribution of each level, cf.  
[Rendleman et al., 2000]
- ▶ Rigorous domain decomposition
  - ▶ Data of all levels resides on same node
  - ▶ Grid hierarchy defines unique "floor-plan"
  - ▶ Redistribution of data blocks during reorganization of hierarchical data
  - ▶ Synchronization when setting ghost cells

## Rigorous domain decomposition formalized

Parallel machine with  $P$  identical nodes.  $P$  non-overlapping portions  $G_0^p$ ,  $p = 1, \dots, P$  as

$$G_0 = \bigcup_{p=1}^P G_0^p \quad \text{with} \quad G_0^p \cap G_0^q = \emptyset \quad \text{for } p \neq q$$

Higher level domains  $G_I$  follow decomposition of root level

$$G_I^p := G_I \cap G_0^p$$

With  $\mathcal{N}_I(\cdot)$  denoting number of cells, we estimate the workload as

$$\mathcal{W}(\Omega) = \sum_{I=0}^{I_{\max}} \left[ \mathcal{N}_I(G_I \cap \Omega) \prod_{\kappa=0}^I r_\kappa \right]$$

Equal work distribution necessitates

$$\mathcal{L}^p := \frac{P \cdot \mathcal{W}(G_0^p)}{\mathcal{W}(G_0)} \approx 1 \quad \text{for all } p = 1, \dots, P$$

[Deiterding, 2005]

# Ghost cell setting

Local synchronization

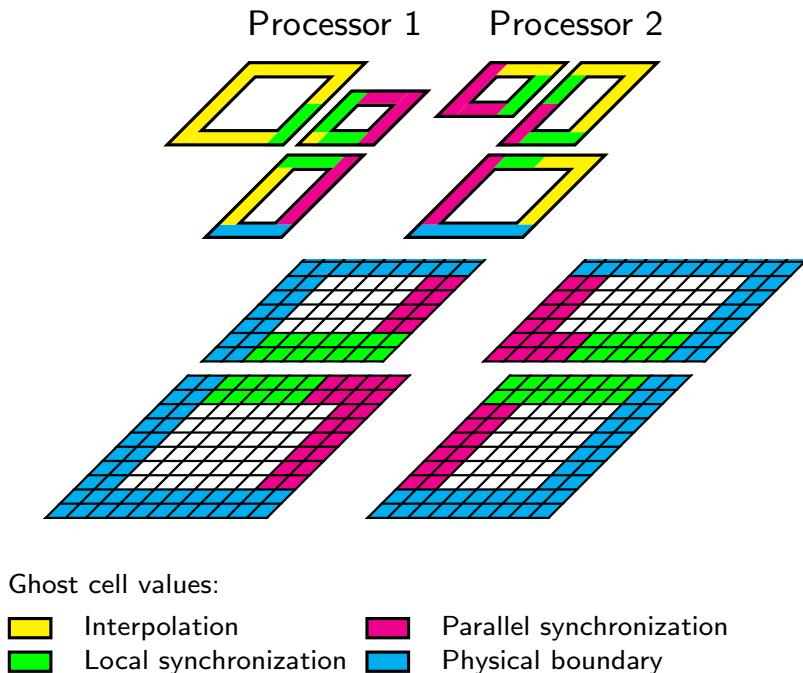

$$\tilde{S}_{I,m}^{s,p} = \tilde{G}_{I,m}^{s,p} \cap G_I^p$$

Parallel synchronization

$$\tilde{S}_{I,m}^{s,q} = \tilde{G}_{I,m}^{s,p} \cap G_I^q, q \neq p$$

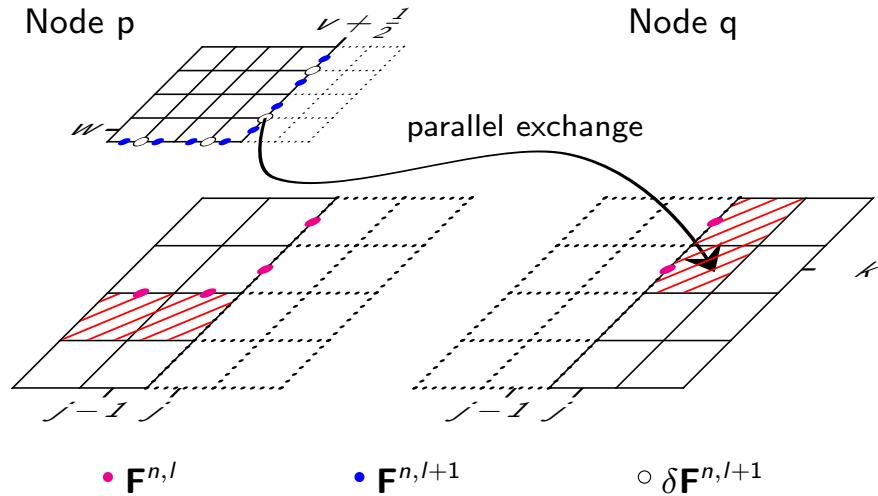

Interpolation and physical boundary conditions remain strictly local

- ▶ Scheme  $\mathcal{H}^{(\Delta t_i)}$  evaluated locally
- ▶ Restriction and prolongation local

## Parallel flux correction

1. Strictly local: Init  $\delta\mathbf{F}^{n,l+1}$  with  $\mathbf{F}^n(\bar{G}_{l,m} \cap \partial G_{l+1}, t)$
2. Strictly local: Add  $\mathbf{F}^n(\partial G_{l,m}, t)$  to  $\delta\mathbf{F}^{n,l}$
3. Parallel communication: Correct  $\mathbf{Q}'(t + \Delta t_l)$  with  $\delta\mathbf{F}^{l+1}$

# The recursive algorithm in parallel

AdvanceLevel( $l$ )

```

Repeat  $r_l$  times
  Set ghost cells of  $\mathbf{Q}^l(t)$ 
  If time to regrid?
    Regrid( $l$ )
  UpdateLevel( $l$ )
  If level  $l+1$  exists?
    Set ghost cells of  $\mathbf{Q}^l(t + \Delta t_l)$ 
    AdvanceLevel( $l+1$ )
    Average  $\mathbf{Q}^{l+1}(t + \Delta t_l)$  onto  $\mathbf{Q}^l(t + \Delta t_l)$ 
    Correct  $\mathbf{Q}^l(t + \Delta t_l)$  with  $\delta\mathbf{F}^{l+1}$ 
   $t := t + \Delta t_l$ 
```

UpdateLevel( $l$ )

```

For all  $m = 1$  To  $M_l$  Do
   $\mathbf{Q}(G_{l,m}^s, t) \xrightarrow{\mathcal{H}(\Delta t_l)} \mathbf{Q}(G_{l,m}, t + \Delta t_l), \mathbf{F}^n(\bar{G}_{l,m}, t)$ 
  If level  $l > 0$ 
    Add  $\mathbf{F}^n(\partial G_{l,m}, t)$  to  $\delta\mathbf{F}^{n,l}$ 
  If level  $l+1$  exists
    Init  $\delta\mathbf{F}^{n,l+1}$  with  $\mathbf{F}^n(\bar{G}_{l,m} \cap \partial G_{l+1}, t)$ 
```

- ▶ Numerical update strictly local
- ▶ Inter-level transfer local
- ▶ Parallel synchronization
- ▶ Application of  $\delta\mathbf{F}^{l+1}$  on  $\partial G_l^q$

# Regridding algorithm in parallel

Regrid( $I$ ) – Regrid all levels  $\iota > I$

```

For  $\iota = I_f$  Downto  $I$  Do
    Flag  $N^\iota$  according to  $Q^\iota(t)$ 
    If level  $\iota + 1$  exists?
        Flag  $N^\iota$  below  $\check{G}^{\iota+2}$ 
        Flag buffer zone on  $N^\iota$ 
        Generate  $\check{G}^{\iota+1}$  from  $N^\iota$ 
 $\check{G}_I := G_I$ 
For  $\iota = I$  To  $I_f$  Do
     $C\check{G}_\iota := G_0 \setminus \check{G}_\iota$ 
     $\check{G}_{\iota+1} := \check{G}_{\iota+1} \setminus C\check{G}_\iota$ 
Recompose( $I$ )

```

- ▶ Need a ghost cell overlap of  $b$  cells to ensure correct setting of refinement flags in parallel
- ▶ Two options exist (we choose the latter):
  - ▶ Global clustering algorithm
  - ▶ Local clustering algorithm and concatenation of new lists  $\check{G}^{\iota+1}$

# Recomposition algorithm in parallel

Recompose( $l$ ) – Reorganize all levels

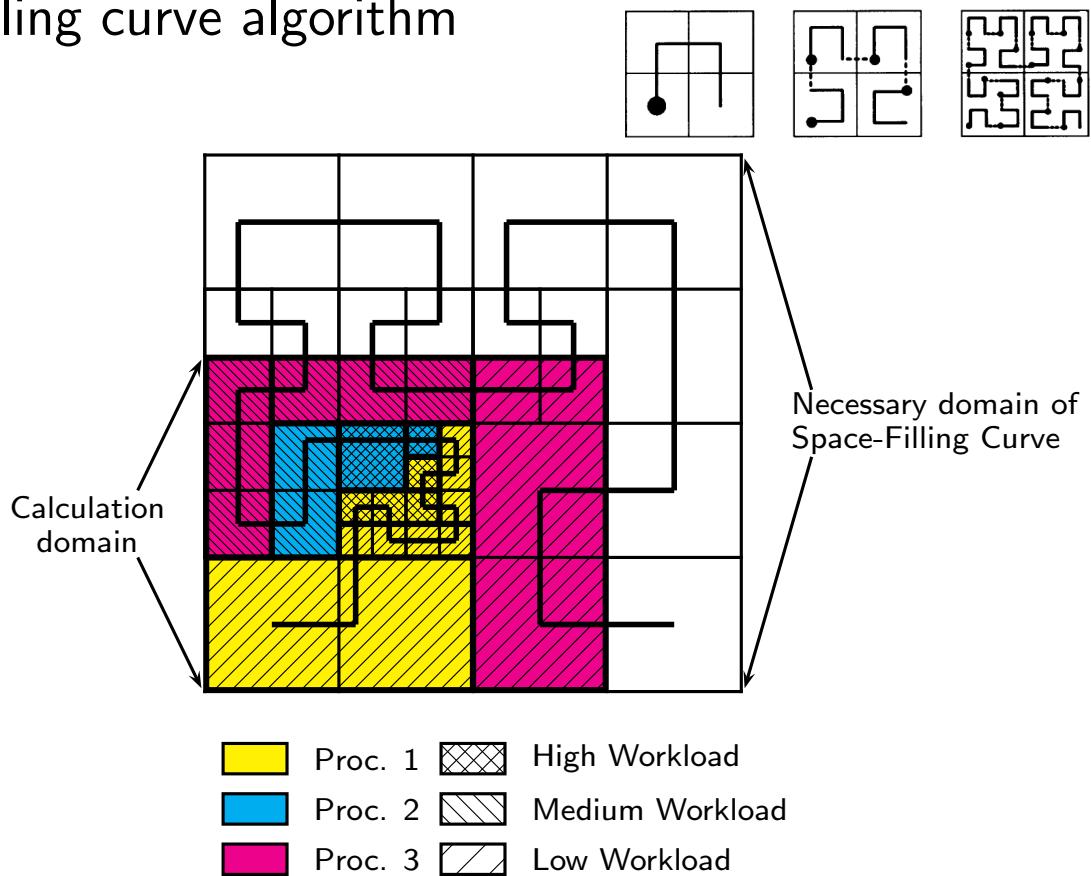

```

Generate  $G_0^P$  from  $\{G_0, \dots, G_l, \check{G}_{l+1}, \dots, \check{G}_{l_f+1}\}$ 
For  $\iota = l + 1$  To  $l_f + 1$  Do
    If  $\iota > l$ 
         $\check{G}_\iota^P := \check{G}_\iota \cap G_0^P$ 
        Interpolate  $\mathbf{Q}^{\iota-1}(t)$  onto  $\check{\mathbf{Q}}^\iota(t)$ 
    else
         $\check{G}_\iota^P := G_\iota \cap G_0^P$ 
        If  $\iota > 0$ 
            Copy  $\delta\mathbf{F}^{n,\iota}$  onto  $\delta\check{\mathbf{F}}^{n,\iota}$ 
             $\delta\mathbf{F}^{n,\iota} := \delta\check{\mathbf{F}}^{n,\iota}$ 
        If  $\iota \geq l$  then  $\kappa_\iota = 0$  else  $\kappa_\iota = 1$ 
        For  $\kappa = 0$  To  $\kappa_\iota$  Do
            Copy  $\mathbf{Q}^\iota(t)$  onto  $\check{\mathbf{Q}}^\iota(t)$ 
            Set ghost cells of  $\check{\mathbf{Q}}^\iota(t)$ 
             $\mathbf{Q}^\iota(t) := \check{\mathbf{Q}}^\iota(t)$ 
         $G_\iota := \check{G}_\iota$ 

```

- ▶ Global redistribution can also be required when regridding higher levels and  $G_0, \dots, G_l$  do not change (drawback of domain decomposition)
- ▶ When  $\iota > l$  do nothing special
- ▶ For  $\iota \leq l$ , redistribute additionally
  - ▶ Flux corrections  $\delta\mathbf{F}^{n,\iota}$
  - ▶ Already updated time level  $\mathbf{Q}^\iota(t + \kappa\Delta t_\iota)$

# High-resolution methods

Objective: Higher-order accuracy in smooth solution regions but no spurious oscillations near large gradients

Consistent monotone methods converge toward the entropy solution, but

## Theorem

*A monotone method is at most first order accurate.*

Proof: [Harten et al., 1976]

## Definition (TVD property)

Scheme  $\mathcal{H}^{(\Delta t)}(\mathbf{Q}^n; j)$  TVD if  $TV(\mathbf{Q}^{j+1}) \leq TV(\mathbf{Q}^j)$  is satisfied for all discrete sequences  $\mathbf{Q}^n$ . Herein,  $TV(\mathbf{Q}^j) := \sum_{j \in \mathbb{Z}} |\mathbf{Q}_{j+1}^j - \mathbf{Q}_j^j|$ .

TVD schemes: no new extrema, local minima are non-decreasing, local maxima are non-increasing (termed *monotonicity-preserving*). *Monotonicity-preserving* higher-order schemes are at least 5-point methods. Proofs: [Harten, 1983]

TVD concept is proven [Godlewski and Raviart, 1996] for scalar schemes only but nevertheless used to construct *high resolution* schemes.

*Monotonicity-preserving scheme can converge toward non-physical weak solutions.*

# MUSCL slope limiting

Monotone Upwind Schemes for Conservation Laws [van Leer, 1979]

$$\tilde{Q}_{j+\frac{1}{2}}^L = Q_j^n + \frac{1}{4} \left[ (1 - \omega) \Phi_{j-\frac{1}{2}}^+ \Delta_{j-\frac{1}{2}} + (1 + \omega) \Phi_{j+\frac{1}{2}}^- \Delta_{j+\frac{1}{2}} \right],$$

$$\tilde{Q}_{j-\frac{1}{2}}^R = Q_j^n - \frac{1}{4} \left[ (1 - \omega) \Phi_{j+\frac{1}{2}}^- \Delta_{j+\frac{1}{2}} + (1 + \omega) \Phi_{j-\frac{1}{2}}^+ \Delta_{j-\frac{1}{2}} \right]$$

with  $\Delta_{j-1/2} = Q_j^n - Q_{j-1}^n$ ,  $\Delta_{j+1/2} = Q_{j+1}^n - Q_j^n$ .

$$\Phi_{j-\frac{1}{2}}^+ := \Phi \left( r_{j-\frac{1}{2}}^+ \right), \quad \Phi_{j+\frac{1}{2}}^- := \Phi \left( r_{j+\frac{1}{2}}^- \right) \quad \text{with} \quad r_{j-\frac{1}{2}}^+ := \frac{\Delta_{j+\frac{1}{2}}}{\Delta_{j-\frac{1}{2}}}, \quad r_{j+\frac{1}{2}}^- := \frac{\Delta_{j-\frac{1}{2}}}{\Delta_{j+\frac{1}{2}}}$$

and *slope limiters*, e.g., *Minmod*

$$\Phi(r) = \max(0, \min(r, 1))$$

Using a midpoint rule for temporal integration, e.g.,

$$Q_j^* = Q_j^n - \frac{1}{2} \frac{\Delta t}{\Delta x} \left( F(Q_{j+1}^n, Q_j^n) - F(Q_j^n, Q_{j-1}^n) \right)$$

and constructing limited values from  $Q^*$  to be used in FV scheme gives a TVD method if

$$\frac{1}{2} \left[ (1 - \omega) \Phi(r) + (1 + \omega) r \Phi \left( \frac{1}{r} \right) \right] < \min(2, 2r)$$

is satisfied for  $r > 0$ . Proof: [Hirsch, 1988]

# Wave Propagation with flux limiting

Wave Propagation Method [LeVeque, 1997] is built on the flux differencing approach  $\mathcal{A}^\pm \Delta := \hat{\mathbf{A}}^\pm(\mathbf{q}_L, \mathbf{q}_R) \Delta \mathbf{q}$  and the waves  $\mathcal{W}_m := a_m \hat{\mathbf{r}}_m$ , i.e.

$$\mathcal{A}^- \Delta \mathbf{q} = \sum_{\hat{\lambda}_m < 0} \hat{\lambda}_m \mathcal{W}_m, \quad \mathcal{A}^+ \Delta \mathbf{q} = \sum_{\hat{\lambda}_m \geq 0} \hat{\lambda}_m \mathcal{W}_m$$

Wave Propagation 1D:

$$\mathbf{Q}^{n+1} = \mathbf{Q}_j^n - \frac{\Delta t}{\Delta x} \left( \mathcal{A}^- \Delta_{j+\frac{1}{2}} + \mathcal{A}^+ \Delta_{j-\frac{1}{2}} \right) - \frac{\Delta t}{\Delta x} \left( \tilde{\mathbf{F}}_{j+\frac{1}{2}} - \tilde{\mathbf{F}}_{j-\frac{1}{2}} \right)$$

with

$$\tilde{\mathbf{F}}_{j+\frac{1}{2}} = \frac{1}{2} |\mathcal{A}| \left( 1 - \frac{\Delta t}{\Delta x} |\mathcal{A}| \right) \Delta_{j+\frac{1}{2}} = \frac{1}{2} \sum_{m=1}^M |\hat{\lambda}_{j+\frac{1}{2}}^m| \left( 1 - \frac{\Delta t}{\Delta x} |\hat{\lambda}_{j+\frac{1}{2}}^m| \right) \tilde{\mathcal{W}}_{j+\frac{1}{2}}^m$$

and wave limiter

$$\tilde{\mathcal{W}}_{j+\frac{1}{2}}^m = \Phi(\Theta_{j+\frac{1}{2}}^m) \mathcal{W}_{j+\frac{1}{2}}^m$$

with

$$\Theta_{j+\frac{1}{2}}^m = \begin{cases} a_{j-\frac{1}{2}}^m / a_{j+\frac{1}{2}}^m, & \hat{\lambda}_{j+\frac{1}{2}}^m \geq 0, \\ a_{j+\frac{3}{2}}^m / a_{j+\frac{1}{2}}^m, & \hat{\lambda}_{j+\frac{1}{2}}^m < 0 \end{cases}$$

# Wave Propagation Method in 2D

Writing  $\tilde{\mathcal{A}}^\pm \Delta_{j\pm 1/2} := \mathcal{A}^+ \Delta_{j\pm 1/2} + \tilde{\mathbf{F}}_{j\pm 1/2}$  one can develop a truly two-dimensional one-step method [Langseth and LeVeque, 2000]

$$\begin{aligned} \mathbf{Q}_{jk}^{n+1} = & \mathbf{Q}_{jk}^n - \frac{\Delta t}{\Delta x_1} \left( \tilde{\mathcal{A}}^- \Delta_{j+\frac{1}{2}, k} - \frac{1}{2} \frac{\Delta t}{\Delta x_2} \left[ \mathcal{A}^- \tilde{\mathcal{B}}^- \Delta_{j+1, k+\frac{1}{2}} + \mathcal{A}^- \tilde{\mathcal{B}}^+ \Delta_{j+1, k-\frac{1}{2}} \right] + \right. \\ & \left. \tilde{\mathcal{A}}^+ \Delta_{j-\frac{1}{2}, k} - \frac{1}{2} \frac{\Delta t}{\Delta x_2} \left[ \mathcal{A}^+ \tilde{\mathcal{B}}^- \Delta_{j-1, k+\frac{1}{2}} + \mathcal{A}^+ \tilde{\mathcal{B}}^+ \Delta_{j-1, k-\frac{1}{2}} \right] \right) \\ & - \frac{\Delta t}{\Delta x_2} \left( \tilde{\mathcal{B}}^- \Delta_{j, k+\frac{1}{2}} - \frac{1}{2} \frac{\Delta t}{\Delta x_1} \left[ \mathcal{B}^- \tilde{\mathcal{A}}^- \Delta_{j+\frac{1}{2}, k+1} + \mathcal{B}^- \tilde{\mathcal{A}}^+ \Delta_{j-\frac{1}{2}, k+1} \right] + \right. \\ & \left. \tilde{\mathcal{B}}^+ \Delta_{j, k-\frac{1}{2}} - \frac{1}{2} \frac{\Delta t}{\Delta x_1} \left[ \mathcal{B}^+ \tilde{\mathcal{A}}^- \Delta_{j+\frac{1}{2}, k-1} + \mathcal{B}^+ \tilde{\mathcal{A}}^+ \Delta_{j-\frac{1}{2}, k-1} \right] \right) \end{aligned}$$

that is stable for

$$\left\{ \max_{j \in \mathbb{Z}} |\hat{\lambda}_{m, j+\frac{1}{2}}| \frac{\Delta t}{\Delta x_1}, \max_{k \in \mathbb{Z}} |\hat{\lambda}_{m, k+\frac{1}{2}}| \frac{\Delta t}{\Delta x_2} \right\} \leq 1, \quad \text{for all } m = 1, \dots, M$$

## Further high-resolution methods

Some further high-resolution methods (good overview in [Laney, 1998]):

- ▶ FCT: 2nd order [Oran and Boris, 2001]
- ▶ ENO/WENO: 3rd order [Shu, 97]
- ▶ PPM: 3rd order [Colella and Woodward, 1984]

3rd order methods must make use of strong-stability preserving Runge-Kutta methods [Gottlieb et al., 2001] for time integration that use a multi-step update

$$\tilde{\mathbf{Q}}_j^v = \alpha_v \mathbf{Q}_j^n + \beta_v \tilde{\mathbf{Q}}_j^{v-1} + \gamma_v \frac{\Delta t}{\Delta x} \left( \mathbf{F}_{j+\frac{1}{2}}(\tilde{\mathbf{Q}}^{v-1}) - \mathbf{F}_{j-\frac{1}{2}}(\tilde{\mathbf{Q}}^{v-1}) \right)$$

with  $\tilde{\mathbf{Q}}^0 := \mathbf{Q}^n$ ,  $\alpha_1 = 1$ ,  $\beta_1 = 0$ ; and  $\mathbf{Q}^{n+1} := \tilde{\mathbf{Q}}^\gamma$  after final stage  $\gamma$

Typical storage-efficient SSPRK(3,3):

$$\begin{aligned} \tilde{\mathbf{Q}}^1 &= \mathbf{Q}^n + \Delta t \mathcal{F}(\mathbf{Q}^n), & \tilde{\mathbf{Q}}^2 &= \frac{3}{4} \mathbf{Q}^n + \frac{1}{4} \tilde{\mathbf{Q}}^1 + \frac{1}{4} \Delta t \mathcal{F}(\tilde{\mathbf{Q}}^1), \\ \mathbf{Q}^{n+1} &= \frac{1}{3} \mathbf{Q}^n + \frac{2}{3} \tilde{\mathbf{Q}}^2 + \frac{2}{3} \Delta t \mathcal{F}(\tilde{\mathbf{Q}}^2) \end{aligned}$$

# Overview

- ▶ “Adaptive Mesh Refinement in Object-oriented C++”
- ▶ ~ 46,000 LOC for C++ SAMR kernel, ~ 140,000 total C++, C, Fortran-77
- ▶ uses parallel hierarchical data structures that have evolved from DAGH
- ▶ Implements explicit SAMR with different finite volume solvers
- ▶ Embedded boundary method, FSI coupling
- ▶ The Virtual Test Facility: AMROC V2.0 plus solid mechanics solvers
- ▶ ~ 430,000 lines of code total in C++, C, Fortran-77, Fortran-90
- ▶ autoconf / automake environment with support for typical parallel high-performance system
- ▶ <http://www.vtf.website> [Deiterding et al., 2006][Deiterding et al., 2007]

# UML design of AMROC

- ▶ Classical framework approach with generic main program in C++
- ▶ Customization / modification in Problem.h include file by derivation from base classes and redefining virtual interface functions
- ▶ Predefined, scheme-specific classes provided for standard simulations
- ▶ Clawpack, WENO: Standard simulations require only linking to F77 functions for initial and boundary conditions, source terms. No C++ knowledge required
- ▶ Expert usage (algorithm modification, advanced output, etc.) in C++

# Commonalities in software design

- ▶ Index coordinate system based on  $\Delta x_{n,l} \cong \prod_{\kappa=l+1}^{l_{\max}} r_\kappa$  to uniquely identify a cell within the hierarchy
- ▶ Box<dim>, BoxList<dim> class that define rectangular regions  $G_{m,l}$  by lowerleft, upperright, stepsize and specify topological operations  $\cap$ ,  $\cup$ , \
- ▶ Patch<dim,type> class that assigns data to a rectangular grid  $G_{m,l}$
- ▶ A class, here GridFunction<dim,type>, that defines topological relations between lists of Patch objects to implement synchronization, restriction, prolongation, re-distribution
- ▶ Hierarchical parallel data structures are typically C++, routines on patches often Fortran

# Hierarchical data structures

Directory `amroc/hds`. Key classes:

- ▶ **Coords**: Point in index coordinator system

`code/amroc/doc/html/hds/classCoords.html`

- ▶ **BBox**: Rectangular region

`code/amroc/doc/html/hds/classBBox.html`

- ▶ **BBoxList**: Set of BBox elements

`code/amroc/doc/html/hds/classBBoxList.html`

- ▶ **GridBox**: Has a BBox member, but adds level and partitioning information

`code/amroc/doc/html/hds/classGridBox.html`

- ▶ **GridBoxList**: Set of GridBox elements

`code/amroc/doc/html/hds/classBBoxList.html`

- ▶ **GridData<Type, dim>**: Creates array data of Type of same dimension as BBox, has extensive math operators

`code/amroc/doc/html/hds/classGridData_3_01Type_00_012_01_4.html`

- ▶ **Vector<Scalar, length>**: Vector of state is usually `Vector<double, N>`

`code/amroc/doc/html/hds/classVector.html`

# Hierarchical data structures - II

- ▶ **GridDataBlock<Type, dim>**: The Patch-class. Has a GridData<Type, dim>member, knows about relations of current patch within AMR hierarchy

<code/amroc/doc/html/hds/classGridDataBlock.html>

- ▶ **GridFunction<Type, dim>**: Uses GridDataBlock<Type, dim>objects to organize hierarchical data of Type after receiving GridBoxLists. Has extensive math operators for whole levels. Recreates GridDataBlock<Type, dim>lists automatically when GridBoxList changes. Calls interlevel operations are automatically when required.

<code/amroc/doc/html/hds/classGridFunction.html>

- ▶ **GridHierarchy<Type, dim>**: Uses sets of GridBoxList to organize topology of the hierarchy. All GridFunction<Type, dim>are members and receive updated GridBoxList after regridding and repartitioning. Calls DAGHDistribution of partitioning. Implements parallel Recompose().

<code/amroc/doc/html/hds/classGridHierarchy.html>

# AMR level

Directory `amroc/amr`. Central class is **AMRSolver<VectorType, FixupType, FlagType, dim>**:

`code/amroc/doc/html/amr/classAMRSolver.html`

- ▶ Uses **Integrator<VectorType, dim>** to interface and call the patch-wise numerical update  
`code/amroc/doc/html/amr/classIntegrator.html`
- ▶ Uses **InitialCondition<VectorType, dim >** to call initial conditions patch-wise  
`code/amroc/doc/html/amr/classInitialCondition.html`
- ▶ Uses **BoundaryConditions<VectorType, dim >** to call boundary conditions per side and patch  
`code/amroc/doc/html/amr/classBoundaryConditions.html`
- ▶ Fortran interfaces to above classes are in `amroc/amr/F77Interfaces`, convenient C++ interfaces in `amroc/amr/Interfaces`.
- ▶ Implements parallel `AdvanceLevel()`, `RegridLevel()`.

# AMR level - II

- ▶ **AMRFixup<VectorType, FixupType, dim>** implements the conservative flux correction, holds lower dimensional GridFunctions for correction terms

<code/amroc/doc/html/amr/classAMRFixup.html>

- ▶ **AMRFlagging<VectorType, FixupType, FlagType, dim>** calls a list of refinement criteria and stores results in scalar GridFunction for flags. All criteria are in amroc/amr/Criteria

<code/amroc/doc/html/amr/classAMRFlagging.html>

- ▶ **LevelTransfer<VectorType, dim>** provides patch-wise interpolation and restriction routines that are passed as parameters to GridFunction

<code/amroc/doc/html/amr/classLevelTransfer.html>

- ▶ **AMRTimestep** implements time step control for a Solver

<code/amroc/doc/html/amr/classAMRTimestep.html>

- ▶ **AMRInterpolation<VectorType, dim>** is an interpolation at arbitrary point location, typically used for post-processing

<code/amroc/doc/html/amr/classAMRInterpolation.html>

Gaussian density shape

$$\rho(x_1, x_2) = 1 + e^{-\left(\frac{\sqrt{x_1^2+x_2^2}}{R}\right)^2}$$

is advected with constant velocities  $u_1 = u_2 \equiv 1$ ,  $p_0 \equiv 1$ ,  $R = 1/4$

- ▶ Domain  $[-1, 1] \times [-1, 1]$ , periodic boundary conditions,  $t_{end} = 2$
- ▶ Two levels of adaptation with  $r_{1,2} = 2$ , finest level corresponds to  $N \times N$  uniform grid

Use *locally* conservative interpolation

$$\check{\mathbf{Q}}_{v,w}^I := \mathbf{Q}_{ij}^I + f_1(\mathbf{Q}_{i+1,j}^I - \mathbf{Q}_{i-1,j}^I) + f_2(\mathbf{Q}_{i,j+1}^I - \mathbf{Q}_{i,j-1}^I)$$

with factor  $f_1 = \frac{x_{1,I+1}^v - x_{1,I}^i}{2\Delta x_{1,I}}$ ,  $f_2 = \frac{x_{2,I+1}^w - x_{2,I}^j}{2\Delta x_{2,I}}$  to also test flux correction

*This prolongation operator is not monotonicity preserving! Only applicable to smooth problems.*

# Components

Directory `amroc/clawpack/src` contains generic Fortran functions:

- ▶ **?d/integrator\_extended**: Contains an extended version of Clawpack 3.0 by R. LeVeque. The MUSCL approach was added, 3d fully implemented, interfaces have been adjusted for AMROC. These codes are equation independent.  
`code/amroc/doc/html/clp/files.html`
- ▶ **?d/equations**: Contains equation-specific Riemann solvers, flux functions as F77 routines.
- ▶ **?d/interpolation**: Contains patch-wise interpolation and restriction operators in F77.

Directory `amroc/clawpack` contains the generic C++ classes to interface the F77 library from `?d/integrator_extended` with AMROC:

- ▶ **ClpIntegrator<VectorType, AuxVectorType, dim >**: Interfaces the F77 library from `?d/integrator_extended` to `Integrator<VectorType, dim>`. Key function to fill is `CalculateGrid()`.

`code/amroc/doc/html/clp/classClpIntegrator_3_01VectorType_00_01AuxVectorType_00_012_01_4.html`

## Components - II

- ▶ **ClpFixup<VectorType, FixupType, AuxVectorType, dim >:** The conservative flux correction is more complex in the waves of the flux difference splitting schemes. This specialization of **AMRFixup<VectorType, FixupType, dim>** considers this.

<code/amroc/doc/html/clp/classClpFixup.html>

- ▶ A generic main program **amroc/clawpack/mains/amr\_main.C** instantiates **Integrator<VectorType, dim>**, **InitialCondition<VectorType, dim >**, **BoundaryConditions<VectorType, dim >**

[code/amroc/doc/html/clp/amr\\_main\\_8C.html](code/amroc/doc/html/clp/amr_main_8C.html)

- ▶ **Problem.h:** Allows simulation-specific alteration in class-library style by derivation from predefined classes specified in **ClpStdProblem.h**

[code/amroc/doc/html/clp/ClpStdProblem\\_8h.html](code/amroc/doc/html/clp/ClpStdProblem_8h.html)

- ▶ **ClpProblem.h:** General include before equation-specific C++ definition file is read that defines VectorType and provides Fortran function names required by **amroc/amr/F77Interfaces** classes

[code/amroc/doc/html/clp/ClpProblem\\_8h\\_source.html](code/amroc/doc/html/clp/ClpProblem_8h_source.html) [code/amroc/doc/html/clp/euler2\\_8h.html](code/amroc/doc/html/clp/euler2_8h.html)

## Functions to link in Makefile.am

Interface objects from amroc/amr/F77Interfaces are used to mimic the interface of standard Clawpack, which constructs specific simulations by linking F77 functions. Required functions are:

- ▶ **init.f**: Initial conditions.
- ▶ **physbd.f**: Boundary conditions.
- ▶ **combl.f**: Initialize application specific common blocks.
- ▶  **$\$(EQUATION)/rp/rpn.f$  and  $rpt.f$** : Equation-specific Riemann solvers in normal and transverse direction.
- ▶  **$\$(EQUATION)/rp/flx.f$ ,  $\$(EQUATION)/rp/rec.f$** : Flux and reconstruction for MUSCL slope limiting (if used), otherwise dummy-routines/flx.f and dummy-routines/rec.f may be used.
- ▶  **$\$(EQUATION)/rp/chk.f$** : Physical consistency check for debugging.
- ▶ **src.f**: Source term for a splitting method., otherwise dummy-routines/src.f can be linked.
- ▶ **setaux.f**: Set data in an additional patch-wise auxiliary array, otherwise dummy-routines/saux.f can be linked.

# Favre-averaged Navier-Stokes equations

$$\begin{aligned} \frac{\partial \bar{\rho}}{\partial t} + \frac{\partial}{\partial x_n} (\bar{\rho} \tilde{u}_n) &= 0 \\ \frac{\partial}{\partial t} (\bar{\rho} \tilde{u}_k) + \frac{\partial}{\partial x_n} (\bar{\rho} \tilde{u}_k \tilde{u}_n + \delta_{kn} \bar{p} - \tilde{\tau}_{kn} + \sigma_{kn}) &= 0 \\ \frac{\partial \bar{\rho} \bar{E}}{\partial t} + \frac{\partial}{\partial x_n} (\tilde{u}_n (\bar{\rho} \bar{E} + \bar{p}) + \tilde{q}_n - \tilde{\tau}_{nj} \tilde{u}_j + \sigma_n^e) &= 0 \\ \frac{\partial}{\partial t} (\bar{\rho} \tilde{Y}_i) + \frac{\partial}{\partial x_n} (\bar{\rho} \tilde{Y}_i \tilde{u}_n + \tilde{J}_n^i + \sigma_n^i) &= 0 \end{aligned}$$

with stress tensor

$$\tilde{\tau}_{kn} = \tilde{\mu} \left( \frac{\partial \tilde{u}_n}{\partial x_k} + \frac{\partial \tilde{u}_k}{\partial x_n} \right) - \frac{2}{3} \tilde{\mu} \frac{\partial \tilde{u}_j}{\partial x_j} \delta_{in},$$

heat conduction

$$\tilde{q}_n = -\tilde{\lambda} \frac{\partial \tilde{T}}{\partial x_n},$$

and inter-species diffusion

$$\tilde{J}_n^i = -\bar{\rho} \tilde{D}_i \frac{\partial \tilde{Y}_i}{\partial x_n}$$

Favre-filtering

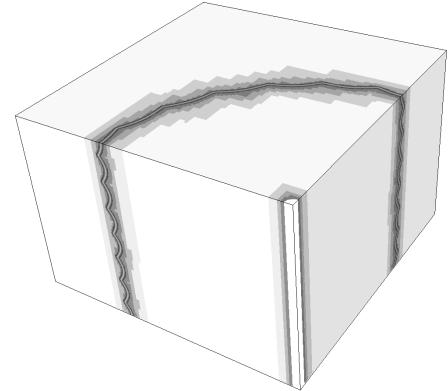

$$\tilde{\phi} = \frac{\rho \bar{\phi}}{\bar{\rho}} \quad \text{with} \quad \bar{\phi}(\mathbf{x}, t; \Delta_c) = \int_{\Omega} G(\mathbf{x} - \mathbf{x}', \Delta_c) \phi(\mathbf{x}', t) d\mathbf{x}'$$

# Numerical solution approach

- ▶ Subgrid terms  $\sigma_{kn}$ ,  $\sigma_n^e$ ,  $\sigma_n^i$  are computed by Pullin's stretched-vortex model
- ▶ Cutoff  $\Delta_c$  is set to local SAMR resolution  $\Delta x_i$
- ▶ It remains to solve the Navier-Stokes equations in the hyperbolic regime
  - ▶ 3rd order WENO method (hybridized with a tuned centered difference stencil) for convection
  - ▶ 2nd order conservative centered differences for diffusion

Example: Cylindrical Richtmyer-Meshkov instability

- ▶ Sinusoidal interface between two gases hit by shock wave
- ▶ Objective is correctly predict turbulent mixing
- ▶ Embedded boundary method used to regularize apex
- ▶ AMR base grid  $95 \times 95 \times 64$  cells,  $r_{1,2,3} = 2$
- ▶  $\sim 70,000$  h CPU on 32 AMD 2.5GHZ-quad-core nodes

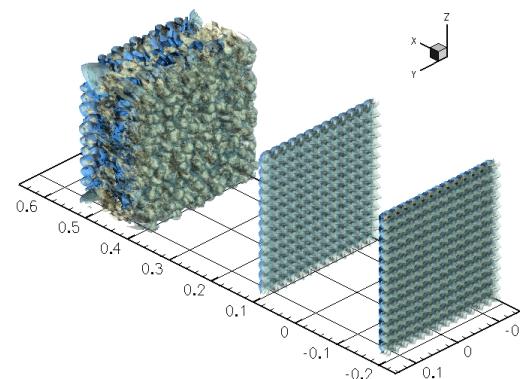

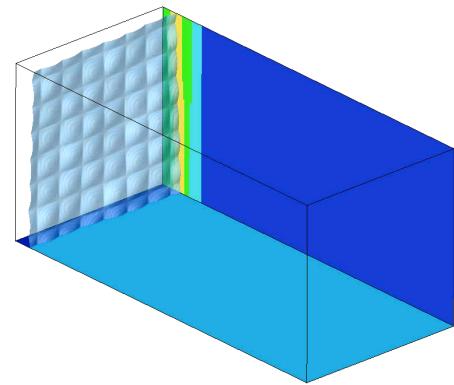

# Planar Richtmyer-Meshkov instability

- ▶ Perturbed Air-SF6 interface shocked and re-shocked by Mach 1.5 shock
- ▶ Containment of turbulence in refined zones
- ▶ 96 CPUs IBM SP2-Power3
- ▶ WENO-TCD scheme with LES model
- ▶ AMR base grid  $172 \times 56 \times 56$ ,  $r_{1,2} = 2$ ,  
10 M cells in average instead of 3 M  
(uniform)

# Flux correction for Runge-Kutta method

Recall Runge-Kutta temporal update

$$\tilde{\mathbf{Q}}_j^v = \alpha_v \mathbf{Q}_j^n + \beta_v \tilde{\mathbf{Q}}_j^{v-1} + \gamma_v \frac{\Delta t}{\Delta x_k} \Delta \mathbf{F}^k(\tilde{\mathbf{Q}}^{v-1})$$

rewrite scheme as

$$\mathbf{Q}^{n+1} = \mathbf{Q}^n - \sum_{v=1}^r \varphi_v \frac{\Delta t}{\Delta x_k} \Delta \mathbf{F}^k(\tilde{\mathbf{Q}}^{v-1}) \quad \text{with} \quad \varphi_v = \gamma_v \prod_{\nu=v+1}^r \beta_\nu$$

Flux correction to be used [Pantano et al., 2007]

1.  $\delta \mathbf{F}_{i-\frac{1}{2},j}^{1,l+1} := -\varphi_1 \mathbf{F}_{i-\frac{1}{2},j}^{1,l}(\tilde{\mathbf{Q}}^0), \quad \delta \mathbf{F}_{i-\frac{1}{2},j}^{1,l+1} := \delta \mathbf{F}_{i-\frac{1}{2},j}^{1,l+1} - \sum_{v=2}^r \varphi_v \mathbf{F}_{i-\frac{1}{2},j}^{1,l}(\tilde{\mathbf{Q}}^{v-1})$
2.  $\delta \mathbf{F}_{i-\frac{1}{2},j}^{1,l+1} := \delta \mathbf{F}_{i-\frac{1}{2},j}^{1,l+1} + \frac{1}{r_{l+1}^2} \sum_{m=0}^{r_{l+1}-1} \sum_{v=1}^r \varphi_v \mathbf{F}_{v+\frac{1}{2},w+m}^{1,l+1} (\tilde{\mathbf{Q}}^{v-1}(t + \kappa \Delta t_{l+1}))$

Storage-efficient SSPRK(3,3):

$v$	$\alpha_v$	$\beta_v$	$\gamma_v$	$\varphi_v$
1	1	0	1	$\frac{1}{6}$
2	$\frac{3}{4}$	$\frac{1}{4}$	$\frac{1}{4}$	$\frac{1}{6}$
3	$\frac{1}{2}$	$\frac{2}{3}$	$\frac{2}{3}$	$\frac{2}{3}$

# Components

Directory `amroc/weno/src` contains the Fortran-90 solver library:

- ▶ **generic**: Implements the hybrid WENO-TCD method for Euler and Navier-Stokes equations, characteristic boundary conditions. Code uses F90 modules.

`code/amroc/doc/html/weno/files.html`

- ▶ **equations**: Contains routines that specify between LES and laminar flow, the criterion for scheme hybridization, source terms handled by splitting.

Directory `amroc/weno` contains the generic C++ class to interface the F90 library with AMROC:

- ▶ **WENOIntegrator<VectorType, dim >**: Interfaces the F90 solver to `Integrator<VectorType, dim>`. `CalculateGrid()` is called separately for each stage of the Runge-Kutta time integrator.

`code/amroc/doc/html/weno/classWENOIntegrator.html`

- ▶ **WENOFixup<VectorType, FixupType, dim >**: A specialized conservative flux correction that accumulates the correction terms throughout the stages of the Runge-Kutta time integrator.

`code/amroc/doc/html/weno/classWENOFixup.html`

## Components - II

- ▶ **WENOInterpolation<VectorType, InterpolationType, OutputType, dim >:** Is a quite elaborate data collection class based on **AMRInterpolation<VectorType, dim>** geared toward statistics processing typical for turbulent simulations. Has run-time function parser.

<code/amroc/doc/html/weno/classWENOStatistics.html>

The interface otherwise follows the Clawpack integration closely:

- ▶ Generic main program **amroc/clawpack/mains/amr\_main.C** is re-used.
- ▶ **Problem.h:** simulation-specific alteration of the C++ predefined classes specified in **WENOStdProblem.h**

[code/amroc/doc/html/weno/WENOStdProblem\\_8h.html](code/amroc/doc/html/weno/WENOStdProblem_8h.html)

- ▶ **WENOProblem.h:** Include required C++ class definitions definitions, all Fortran function names defined in **WENOStdFunctions.h**

[code/amroc/doc/html/weno/WENOProblem\\_8h\\_source.html](code/amroc/doc/html/weno/WENOProblem_8h_source.html) [code/amroc/doc/html/weno/WENOStdFunctions\\_8h.html](code/amroc/doc/html/weno/WENOStdFunctions_8h.html)

- ▶ Interface objects from **amroc/amr/F77Interfaces** re-used and functions linked in Makefile.am as with Clawpack integrator

# Governing equations

$$\begin{aligned} \frac{\partial \rho}{\partial t} + \nabla \cdot (\rho \mathbf{u}) &= 0 \\ \frac{\partial \rho \mathbf{u}}{\partial t} + \nabla \cdot \left[ \rho \mathbf{u}^t \mathbf{u} + \left( p + \frac{\mathbf{B} \cdot \mathbf{B}}{2} \right) \mathbf{I} - \mathbf{B}^t \mathbf{B} \right] &= \mathbf{0} \\ \frac{\partial \rho E}{\partial t} + \nabla \cdot \left[ \left( \rho E + p + \frac{\mathbf{B} \cdot \mathbf{B}}{2} \right) \mathbf{u} - (\mathbf{u} \cdot \mathbf{B}) \mathbf{B} \right] &= 0 \\ \frac{\partial \mathbf{B}}{\partial t} + \nabla \cdot (\mathbf{u}^t \mathbf{B} - \mathbf{B}^t \mathbf{u}) &= \mathbf{0} \end{aligned}$$

with equation of state

$$p = (\gamma - 1) \left( \rho E - \rho \frac{\mathbf{u}^2}{2} - \frac{\mathbf{B}^2}{2} \right)$$

The ideal MDH model is still hyperbolic, yet by re-writing the induction equation, one finds that the magnetic field has to satisfy at all times  $t$  the elliptic constraint

$$\nabla \cdot \mathbf{B} = 0.$$

# Generalized Lagrangian multipliers for divergence control

Hyperbolic-parabolic correction of 2d ideal MHD model [Dedner et al., 2002]:

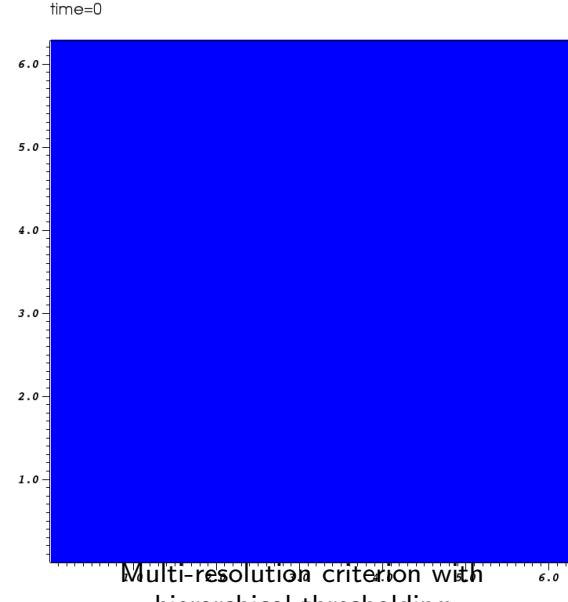

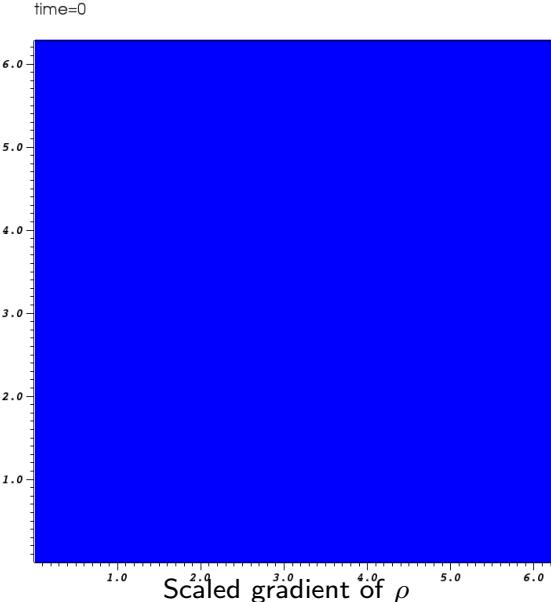

$$\begin{aligned}
 \frac{\partial \rho}{\partial t} + \frac{\partial \rho u_x}{\partial x} + \frac{\partial \rho u_y}{\partial y} &= 0 \\
 \frac{\partial (\rho u_x)}{\partial t} + \frac{\partial}{\partial x} \left[ \rho u_x^2 + p \left( p + \frac{\mathbf{B} \cdot \mathbf{B}}{2} \right) - B_x^2 \right] + \frac{\partial}{\partial y} (\rho u_x u_y - B_x B_y) &= 0 \\
 \frac{\partial (\rho u_y)}{\partial t} + \frac{\partial}{\partial x} (\rho u_x u_y - B_x B_y) + \frac{\partial}{\partial y} \left[ \rho u_y^2 + p \left( p + \frac{\mathbf{B} \cdot \mathbf{B}}{2} \right) - B_y^2 \right] &= 0 \\
 \frac{\partial (\rho u_z)}{\partial t} + \frac{\partial}{\partial x} (\rho u_z u_x - B_z B_x) + \frac{\partial}{\partial y} (\rho u_z u_y - B_z B_y) &= 0 \\
 \frac{\partial \rho E}{\partial t} + \frac{\partial}{\partial x} \left[ \left( \rho E + p + \frac{\mathbf{B} \cdot \mathbf{B}}{2} \right) \mathbf{u}_x - (\mathbf{u} \cdot \mathbf{B}) B_x \right] + \frac{\partial}{\partial y} \left[ \left( \rho E + p + \frac{\mathbf{B} \cdot \mathbf{B}}{2} \right) \mathbf{u}_y - (\mathbf{u} \cdot \mathbf{B}) B_y \right] &= 0 \\
 \frac{\partial B_x}{\partial t} + \frac{\partial \psi}{\partial x} + \frac{\partial}{\partial y} (u_y B_x - B_y u_x) &= 0 \\
 \frac{\partial B_y}{\partial t} + \frac{\partial}{\partial x} (u_x B_y - B_x u_y) + \frac{\partial \psi}{\partial y} &= 0 \\
 \frac{\partial B_z}{\partial t} + \frac{\partial}{\partial x} (u_x B_z - B_z u_x) + \frac{\partial}{\partial y} (u_y B_z - B_y u_z) &= 0 \\
 \frac{\partial \psi}{\partial t} + c_h^2 \left( \frac{\partial B_x}{\partial x} + \frac{\partial B_y}{\partial y} \right) &= -\frac{c_h^2}{c_p^2} \psi
 \end{aligned}$$

# Orszag-Tang vortex

- ▶ Adaptive solution on  $50 \times 50$  grid with 4 additional levels refined by  $r_l = 2$
- ▶ Initial condition

$$\rho(x, y, 0) = \gamma^2, \quad u_x(x, y, 0) = -\sin(y), \quad u_y(x, y, 0) = \sin(x), \quad u_z(x, y, 0) = 0$$

$$p(x, y, 0) = \gamma, \quad B_x(x, y, 0) = -\sin(y), \quad B_y(x, y, 0) = 2\sin(x), \quad B_z(x, y, 0) = 0$$

[code/amroc/doc/html/apps/mhd\\_2applications\\_2eglm\\_22d\\_20rszagTangVortex\\_2src\\_2Problem\\_8h\\_source.html](code/amroc/doc/html/apps/mhd_2applications_2eglm_22d_20rszagTangVortex_2src_2Problem_8h_source.html)

# Classes

Directory `amroc/mhd` contains the integrator that is in C++ throughout:

- ▶ **EGLM2D<DataType >**: GLM method in 2d plus standard initial and boundary conditions. Internal functions for flux evaluation, MUSCL reconstruction, etc. are member functions.

`code/amroc/doc/html/mhd/classEGLM2D.html`

- ▶ Is derived from **SchemeBase<vector\_type, dim >**, which is designed for the C++ interface classes in `amroc/amr/Interfaces`.

`code/amroc/doc/html/amr/classSchemeBase.html`

- ▶ **amroc/amr/Interfaces**: Provides **SchemeIntegrator<SchemeType, dim >**, **SchemeInitialCondition<SchemeType, dim >**, **SchemeBoundaryCondition<SchemeType, dim >** and further interfaces that use classes derived from **SchemeBase<vector\_type, dim >** as template parameter. This provides a single-class location for new schemes in C++.

`code/amroc/doc/html/amr/classSchemeIntegrator.html` `code/amroc/doc/html/amr/classSchemeInitialCondition.html`

- ▶ **Problem.h**: Specific simulation is defined in `Problem.h` only. Predefined classes specified in **MHDSdpProblem.h** and **MHDProblem.h** similar but simpler as before.

`code/amroc/doc/html/mhd/MHDSdpProblem_8h.html` `code/amroc/doc/html/mhd/MHDProblem_8h_source.html`

# Further hyperbolic solvers

- ▶ **amroc/rim:** Riemann invariant manifold method. 2d implementation in F77 with straightforward integration into AMROC.

<code/amroc/doc/html/rim/files.html>

- ▶ **amroc/balans:** 2nd order accurate central difference scheme. 2d implementation in F77 and excellent template for Fortran scheme incorporation into AMROC.

<code/amroc/doc/html/balans/files.html>

- Cartesian techniques
- Implicit geometry representation
- Accuracy / verification
- Implementation

## Combustion

- Equations
- Upwind schemes for combustion
- Tests with one-step chemistry
- Shock-induced combustion with real chemistry

# Outline

## Complex geometry

- Boundary aligned meshes
- Cartesian techniques
- Implicit geometry representation
- Accuracy / verification
- Implementation

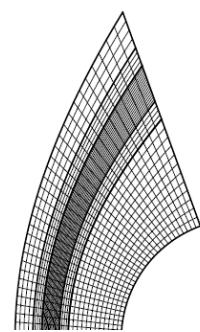

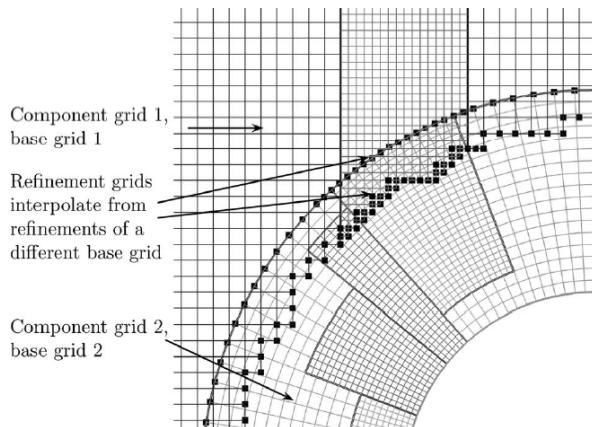

## Combustion

- Equations
- Upwind schemes for combustion
- Tests with one-step chemistry
- Shock-induced combustion with real chemistry

# SAMR on boundary aligned meshes

Analytic or stored geometric mapping of the coordinates  
 (graphic from [Yamaleev and Carpenter, 2002])

- ▶ Topology remains unchanged and thereby entire SAMR algorithm
- ▶ Patch solver and interpolation need to consider geometry transformation
- ▶ Handles boundary layers well

Overlapping adaptive meshes  
 [Henshaw and Schwendeman, 2003],  
 [Meakin, 1995]

- ▶ Idea is to use a non-Cartesian structured grids only near boundary
- ▶ Very suitable for moving objects with boundary layers
- ▶ Interpolation between meshes is usually non-conservative

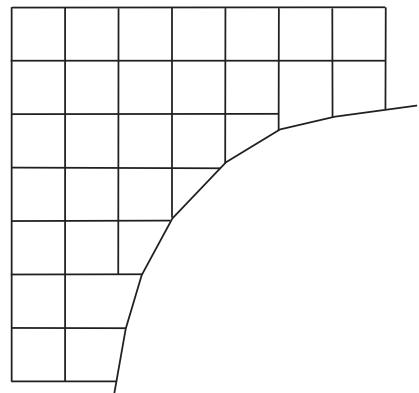

# Cut-cell techniques

Accurate embedded boundary method

$$V_j^{n+1} \mathbf{Q}_j^{n+1} = V_j^n \mathbf{Q}_j^n - \Delta t \left( A_{j+1/2}^{n+1/2} \mathbf{F}(\mathbf{Q}, j) - A_{j-1/2}^{n+1/2} \mathbf{F}(\mathbf{Q}, j-1) \right)$$

Methods that represent the boundary sharply:

- ▶ Cut-cell approach constructs appropriate finite volumes
  - ▶ Conservative by construction. Correct boundary flux
  - ▶ Key question: How to avoid small-cell time step restriction in explicit methods?
    - ▶ Cell merging: [Quirk, 1994a]
  - ▶ Usually explicit geometry representation used [Aftosmis, 1997], but can also be implicit, cf. [Nourgaliev et al., 2003], [Murman et al., 2003]

# Embedded boundary techniques

Volume of fluid methods that resemble a cut-cell technique on purely Cartesian mesh

- Redistribution of boundary flux achieves conservation and bypasses time step restriction: [Pember et al., 1999], [Berger and Helzel, 2002]

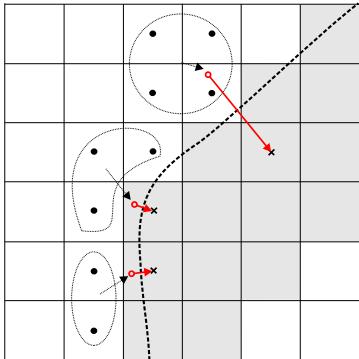

Methods that diffuse the boundary in one cell (good overview in [Mittal and Iaccarino, 2005]):

- ▶ Related to the immersed boundary method by Peskin, cf. [Roma et al., 1999]
  - ▶ Boundary prescription often by internal ghost cell values, cf. [Tseng and Ferziger, 2003]
  - ▶ Not conservative by construction but conservative correction possible
  - ▶ Usually combined with implicit geometry representation

K. J. Richards et al., On the use of the immersed boundary method for engine modeling

# Level-set method for boundary embedding

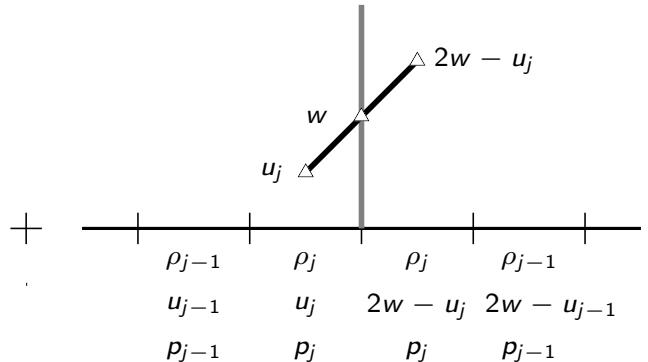

- ▶ Implicit boundary representation via distance function  $\varphi$ , normal  $\mathbf{n} = \nabla\varphi/|\nabla\varphi|$
- ▶ Complex boundary moving with local velocity  $\mathbf{w}$ , treat interface as moving rigid wall
- ▶ Construction of values in embedded boundary cells by interpolation / extrapolation

Interpolate / constant value extrapolate values at

$$\tilde{\mathbf{x}} = \mathbf{x} + 2\varphi\mathbf{n}$$

Velocity in ghost cells

$$\begin{aligned}\mathbf{u}' &= (2\mathbf{w} \cdot \mathbf{n} - \mathbf{u} \cdot \mathbf{n})\mathbf{n} + (\mathbf{u} \cdot \mathbf{t})\mathbf{t} \\ &= 2((\mathbf{w} - \mathbf{u}) \cdot \mathbf{n})\mathbf{n} + \mathbf{u}\end{aligned}$$

# Closest point transform algorithm

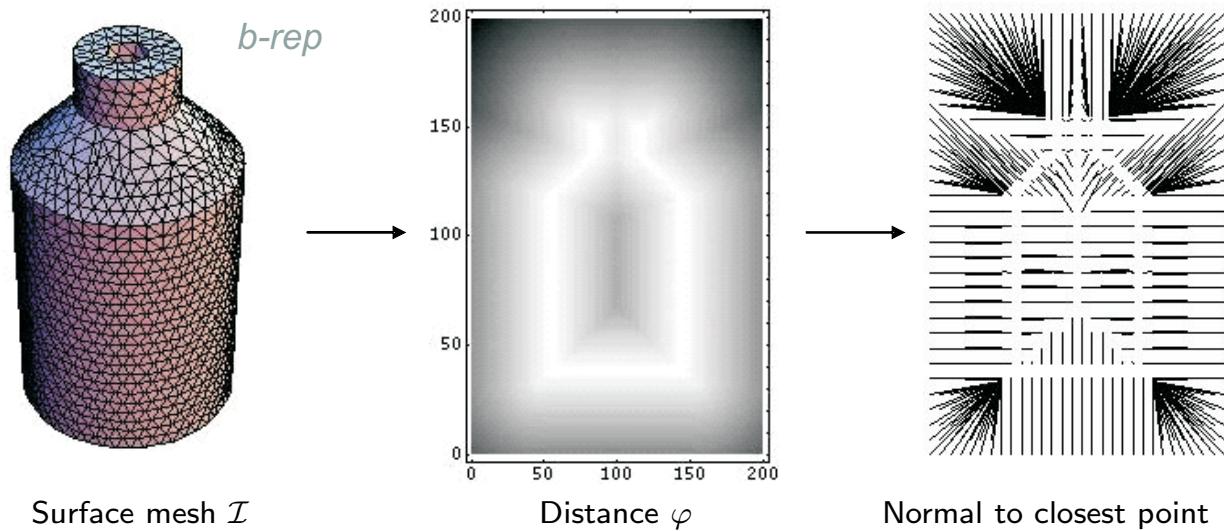

The signed distance  $\varphi$  to a surface  $\mathcal{I}$  satisfies the eikonal equation [Sethian, 1999]

$$|\nabla \varphi| = 1 \quad \text{with} \quad \varphi|_{\mathcal{I}} = 0$$

Solution smooth but non-differentiable across characteristics.

Distance computation trivial for non-overlapping elementary shapes but difficult to do efficiently for triangulated surface meshes:

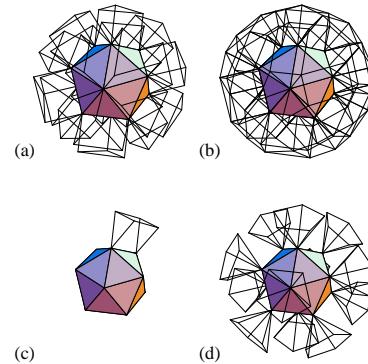

- ▶ Geometric solution approach with plosest-point-transform algorithm [Mauch, 2003]

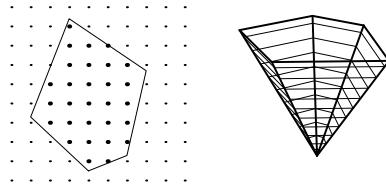

## The characteristic / scan conversion algorithm

1. Build the characteristic polyhedrons for the surface mesh
  2. For each face/edge/vertex
    - 2.1 Scan convert the polyhedron.
    - 2.2 Compute distance to that primitive for the scan converted points
  3. Computational complexity.
    - ▶  $O(m)$  to build the b-rep and the polyhedra.
    - ▶  $O(n)$  to scan convert the polyhedra and compute the distance, etc.
  4. Problem reduction by evaluation only within specified max. distance

## Characteristic polyhedra for faces, edges, and vertices

## Slicing and scan conversion of apolygon

[Mauch, 2003], see also  
[Deiterding et al., 2006]

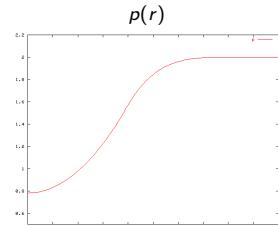

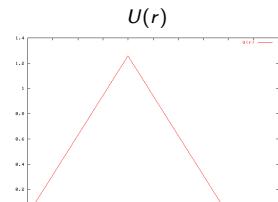

## Accuracy test: stationary vortex

Construct non-trivial *radially symmetric* and *stationary* solution by balancing hydrodynamic pressure and centripetal force per volume element, i.e.

$$\frac{d}{dr} p(r) = \rho(r) \frac{U(r)^2}{r}$$

For  $\rho_0 \equiv 1$  and the velocity field

$$U(r) = \alpha \cdot \begin{cases} 2r/R & \text{if } 0 < r < R/2, \\ 2(1 - r/R) & \text{if } R/2 \leq r \leq R, \\ 0 & \text{if } r > R, \end{cases}$$

one gets with boundary condition  $p(R) = p_0 \equiv 2$  the pressure distribution

$$p(r) = p_0 + 2\rho_0\alpha^2 \cdot \begin{cases} r^2/R^2 + 1 - 2\log 2 & \text{if } 0 < r < R/2, \\ r^2/R^2 + 3 - 4r/R + 2\log(r/R) & \text{if } R/2 \leq r \leq R, \\ 0 & \text{if } r > R. \end{cases}$$

Entire solution for Euler equations reads

$$\rho(x_1, x_2, t) = \rho_0, \quad u_1(x_1, x_2, t) = -U(r) \sin \phi, \quad u_2(x_1, x_2, t) = U(r) \cos \phi, \quad p(x_1, x_2, t) = p(r)$$

for all  $t \geq 0$  with  $r = \sqrt{(x_1 - x_{1,c})^2 + (x_2 - x_{2,c})^2}$  and  $\phi = \arctan \frac{x_2 - x_{2,c}}{x_1 - x_{1,c}}$

# Stationary vortex: results

Compute one full rotation, Roe solver, embedded slip wall boundary conditions  
 $x_{1,c} = 0.5, x_{2,c} = 0.5, R = 0.4, t_{end} = 1, \Delta h = \Delta x_1 = \Delta x_2 = 1/N, \alpha = R\pi$

# Governing equations for premixed combustion

Euler equations with reaction terms

$$\begin{aligned}\frac{\partial \rho_i}{\partial t} + \frac{\partial}{\partial x_n} (\rho_i u_n) &= \dot{\omega}_i , \quad i = 1, \dots, K \\ \frac{\partial}{\partial t} (\rho u_k) + \frac{\partial}{\partial x_n} (\rho u_k u_n + \delta_{kn} p) &= 0 , \quad k = 1, \dots, d \\ \frac{\partial}{\partial t} (\rho E) + \frac{\partial}{\partial x_n} (u_n (\rho E + p)) &= 0\end{aligned}$$

Ideal gas law and Dalton's law for gas-mixtures

$$p(\rho_1, \dots, \rho_K, T) = \sum_{i=1}^K p_i = \sum_{i=1}^K \rho_i \frac{\mathcal{R}}{W_i} T = \rho \frac{\mathcal{R}}{W} T \quad \text{with} \quad \sum_{i=1}^K \rho_i = \rho, \quad Y_i = \frac{\rho_i}{\rho}$$

Caloric equation

$$h(Y_1, \dots, Y_K, T) = \sum_{i=1}^K Y_i h_i(T) \quad \text{with} \quad h_i(T) = h_i^0 + \int_0^T c_{pi}(s) ds$$

Computation of  $T = T(\rho_1, \dots, \rho_K, e)$  from implicit equation

$$\sum_{i=1}^K \rho_i h_i(T) - \mathcal{R} T \sum_{i=1}^K \frac{\rho_i}{W_i} - \rho e = 0$$

for *thermally perfect* gases with  $\gamma_i(T) = c_{pi}(T)/c_{vi}(T)$

# Chemistry

## Arrhenius-Kinetics:

$$\dot{\omega}_i = \sum_{j=1}^M (\nu_{ji}^r - \nu_{ji}^f) \left[ k_j^f \prod_{n=1}^K \left( \frac{\rho_n}{W_n} \right)^{\nu_{jn}^f} - k_j^r \prod_{n=1}^K \left( \frac{\rho_n}{W_n} \right)^{\nu_{jn}^r} \right] \quad i = 1, \dots, K$$

- ▶ Parsing of mechanisms with Chemkin-II
  - ▶ Evaluation of  $\dot{\omega}$  with automatically generated optimized Fortran-77 functions in the line of Chemkin-II

Integration of reaction rates: ODE integration in  $\mathcal{S}^{(\cdot)}$  for Euler equations with chemical reaction

- ▶ Standard implicit or semi-implicit ODE-solver subcycles within each cell
  - ▶  $\rho, e, u_k$  remain unchanged!

$$\partial_t \rho_i = W_i \dot{\omega}_i(\rho_1, \dots, \rho_K, T) \quad i = 1, \dots, K$$

Use Newton or bisection method to compute  $T$  iteratively.

# Hyperbolicity of the homogeneous equations

Consider Jacobian  $\mathbf{A}_1(\mathbf{q}) = \partial \mathbf{f}_1(\mathbf{q}) / \partial \mathbf{q}$

$$\mathbf{A}_1(\mathbf{q}) = \begin{bmatrix} u_1(1 - Y_1) & -u_1 Y_1 & \cdots & -u_1 Y_1 & Y_1 & 0 & 0 \\ -u_1 Y_2 & u_1(1 - Y_2) & \cdots & -u_1 Y_2 & \vdots & \vdots & \vdots \\ \vdots & \ddots & \ddots & \vdots & \vdots & \vdots & \vdots \\ -u_1 Y_{K-1} & \cdots & u_1(1 - Y_{K-1}) & -u_1 Y_{K-1} & Y_K & 0 & 0 \\ -u_1 Y_K & \cdots & -u_1 Y_K & u_1(1 - Y_K) & (3 - \gamma)u_1 & -\tilde{\gamma}u_2 & \tilde{\gamma} \\ \phi_1 - u_1^2 & \cdots & \phi_K - u_1^2 & \vdots & u_2 & u_1 & 0 \\ -u_1 u_2 & \cdots & -u_1 u_2 & \vdots & \vdots & \vdots & \vdots \\ u_1(\phi_1 - H) & \cdots & u_1(\phi_K - H) & H - \tilde{\gamma}u_1^2 & -\tilde{\gamma}u_1 u_2 & \gamma u_1 & \gamma u_1 \end{bmatrix}$$

with

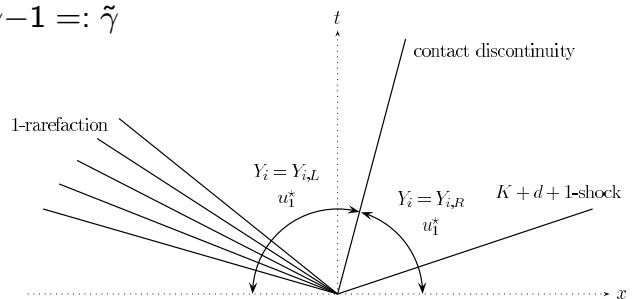

$$\frac{\partial p}{\partial \rho_i} = \tilde{\gamma} \left( \frac{u^2}{2} - h_i \right) + \gamma R_i T =: \phi_i \quad \text{und} \quad \frac{\partial p}{\partial \tilde{E}} = \gamma - 1 =: \tilde{\gamma}$$

Eigenvalues of  $\mathbf{A}_1(\mathbf{q})$  are  
 $\{u_1 - a, u, \dots, u_1, u_1 + a\}$ .

The system is hyperbolic, if the frozen speed of sound  $a$  is given by

$$a^2 = \left( \frac{\partial p}{\partial \rho} \right)_{s, Y_i} = \sum_{i=1}^K Y_i \phi_i - \tilde{\gamma} \mathbf{u}^2 + \tilde{\gamma} H = \gamma \frac{p}{\rho} > 0.$$

is real.

## Steger-Warming flux vector splitting

$$\mathbf{f}(\mathbf{q})^+ = \mathbf{R}\Lambda^+\mathbf{R}^{-1}\mathbf{q} \quad \mathbf{f}(\mathbf{q})^- = \mathbf{R}\Lambda^-\mathbf{R}^{-1}\mathbf{q}$$

$$\mathbf{f}^\pm(\mathbf{q}) = \mathbf{A}^\pm(\mathbf{q})\mathbf{q} = \frac{\rho}{2\gamma} \begin{pmatrix} Y_1\tau^\pm \\ \vdots \\ Y_K\tau^\pm \\ u_1\tau^\pm - a\xi^\pm \\ u_2\tau^\pm \\ \vdots \\ u_d\tau^\pm \\ H\tau^\pm - u_1a\xi^\pm - 2\delta^\pm a^2 \end{pmatrix} \quad \text{with} \quad \begin{aligned} \delta^\pm &= \lambda_2^\pm = \cdots = \lambda_{K+d}^\pm, \\ \tau^\pm &= \lambda_1^\pm + 2\delta^\pm(\gamma - 1) \\ &\quad + \lambda_{K+d+1}^\pm, \\ \xi^\pm &= \lambda_1^\pm - \lambda_{K+d+1}^\pm. \end{aligned}$$

The corresponding stability condition is

$$C_{CFL}^{SW} := \max_{j \in \mathbb{Z}} (|u_{1,j}| + a_j) \leq 1$$

[Grossmann and Cinella, 1990, Larroutuou and Fezoui, 1989, Liu and Vinokur, 1989]

code/amroc/doc/html/clp/rp1eurhokswg.f\_fsource.html

## Van Leer flux vector splitting

$$\mathbf{f}^\pm(\mathbf{q}) = \pm \frac{\rho}{4a} (u_1 \pm a)^2 \begin{bmatrix} Y_1 \\ \vdots \\ Y_K \\ u_1 - (u_1 \mp 2a)/\gamma \\ u_2 \\ \vdots \\ u_d \\ H - \zeta(u_1 \mp a)^2 \end{bmatrix} \quad \text{with} \quad \begin{aligned} H &= h + \frac{\mathbf{u}^2}{2}, \\ \zeta &= \frac{h/a^2}{1 + 2h/a^2}. \end{aligned}$$

The splitting is explicitly constructed for  $-a \leq u_1 \leq a$ . Otherwise, we use

$$\mathbf{f}(\mathbf{q})^+ = \mathbf{f}(\mathbf{q}), \quad \mathbf{f}(\mathbf{q})^- = 0 \quad \text{if } u_1 \geq a$$

$$\mathbf{f}(\mathbf{q})^- = \mathbf{f}(\mathbf{q}), \quad \mathbf{f}(\mathbf{q})^+ = 0 \quad \text{if } u_1 \leq -a$$

## Stability condition

$$C_{CFL}^{VL} := \max_{j \in \mathbb{Z}} [(|u_{1,j}| + a_j) \Pi_j] \frac{\Delta t}{\Delta x} \leq 1$$

$$\text{with } \Pi_j = \begin{cases} \frac{\gamma_j + 3}{2\gamma_j + u_{1,j}(3 - \gamma_j)/a_j} & \text{if } |u_{1,j}| < a_j, \\ 1 & \text{otherwise.} \end{cases}$$

[Shuen et al., 1990, Liu and Vinokur, 1989, Larroutuou and Fezoui, 1989, Grossmann and Cinella, 1990] [code/amroc/doc/html/clp/rp1eurhokvlg.f\\_fsouce.html](#)

# Roe solver

Roe averages  $\hat{\rho}, \hat{u}, \hat{v}, \hat{H}, \hat{W}, \hat{T}, \hat{h}_i, \hat{e}_i, \hat{Y}_i$

Define  $\hat{c}_{pi} = \frac{1}{T_r - T_l} \int_{T_l}^{T_r} c_{pi}(\tau) d\tau, \quad \hat{c}_{vi} = \frac{1}{T_r - T_l} \int_{T_l}^{T_r} c_{vi}(\tau) d\tau$

$$\Delta f := f(q_R) - f(q_L) = \sum_{m=1}^M a_m \lambda_m(\hat{q}) r_m(\hat{q}) \quad \text{with} \quad \Delta q := q_R - q_L = \sum_{m=1}^M a_m r_m(\hat{q}).$$

With matrix of right eigenvectors

$$R_1(q) = \begin{bmatrix} Y_1 & 1 & 0 & \dots & 0 & 0 & 0 & Y_1 \\ & 0 & & & & & & \\ \vdots & \vdots & \ddots & & \vdots & \vdots & \vdots & \vdots \\ & & & & 0 & & & \\ Y_K & 0 & \dots & 0 & 1 & 0 & 0 & Y_K \\ u_1 - a & u_1 & \dots & u_1 & 0 & 0 & 0 & u_1 + a \\ u_2 & u_2 & \dots & u_2 & 1 & 0 & 0 & u_2 \\ u_3 & u_3 & \dots & u_3 & 0 & 1 & 0 & u_3 \\ H - u_1 a & u^2 - \frac{\phi_1}{\bar{\gamma}} & \dots & u^2 - \frac{\phi_K}{\bar{\gamma}} & u_2 & u_3 & H + u_1 a & \end{bmatrix}$$

and evaluating  $R^{-1}(\hat{q})\Delta q$  one gets the characteristic wave strengths eventually as

$$a_1, a_{K+d+1} = \frac{\Delta p \mp \hat{\rho} \hat{a} \Delta u_1}{2 \hat{a}^2}, \quad a_{1+i} = \Delta \rho_i - \hat{Y}_i \frac{\Delta p}{\hat{a}^2}, \quad a_{K+n} = \hat{\rho} \Delta u_n.$$

[code/amroc/doc/html/clp/rp1eurhok.f\\_source.html](code/amroc/doc/html/clp/rp1eurhok.f_source.html)

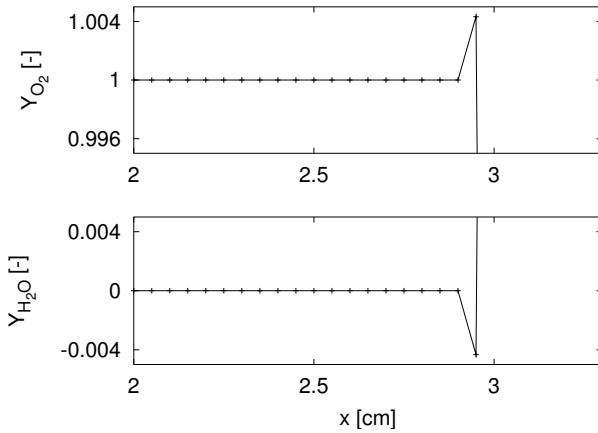

# Roe solver - fixes

Mass fraction positivity: Calculate numerical fluxes of partial densities by [Larroutrou, 1991]

$$\mathbf{F}_i^*(\mathbf{q}_L, \mathbf{q}_R) = \mathbf{F}_\rho(\mathbf{q}_L, \mathbf{q}_R) \cdot \begin{cases} Y_{i,L}, & \mathbf{F}_\rho(\mathbf{q}_L, \mathbf{q}_R) > 0, \\ Y_{i,R}, & \mathbf{F}_\rho(\mathbf{q}_L, \mathbf{q}_R) < 0. \end{cases}$$

to ensure positivity of  $Y_i$ .

Example: Mass fraction for a typical Riemann problem after 1 time step with the Roe solver

Further: Switch from Roe to HLL scheme near vacuum state to avoid unphysical values.

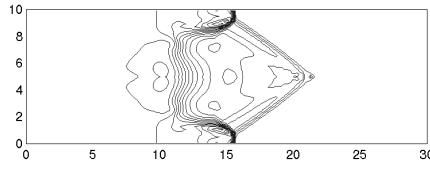

# Roe solver - entropy and carbuncle fix

Entropy corrections [Harten, 1983]  
 [Harten and Hyman, 1983]

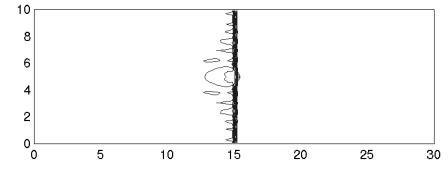

1.  $|\tilde{s}_\ell| = \begin{cases} |s_\ell| & \text{if } |s_\ell| \geq 2\eta \\ \frac{|s_\ell^2|}{4\eta} + \eta & \text{otherwise} \end{cases}$   
 $\eta = \frac{1}{2} \max_\ell \{|s_\ell(\mathbf{q}_R) - s_\ell(\mathbf{q}_L)|\}$
2. Replace  $|s_\ell|$  by  $|\tilde{s}_\ell|$  only if  $s_\ell(\mathbf{q}_L) < 0 < s_\ell(\mathbf{q}_R)$

$$\tilde{\eta}_{i+1/2,j} = \max \{ \eta_{i+1/2,j}, \eta_{i,j-1/2}, \eta_{i,j+1/2}, \eta_{i+1,j-1/2}, \eta_{i+1,j+1/2} \}$$

# ZND Detonation Model with Simplified Chemistry

Assume a stationary 1D detonation with irreversible reaction

with energy release  $q_0 = -\Delta h^0$  and  $k^f(T) = K \exp(-E_A/\mathcal{R}T)$ .

Simplified Kinetics  $\dot{W}_A \dot{\omega}_A = -K \rho_A \exp(-E_A/\mathcal{R}T)$ ,  $\dot{W}_B \dot{\omega}_B = -W_A \dot{\omega}_A$

With  $\gamma_A = \gamma_B$  the equation of state is  $p(\rho_A, \rho_B, e) = (\gamma - 1)(\rho e - \rho_A q_0)$

Integration of the stationary 1D Euler equations

$$\partial_{x'}(\rho u') = 0, \quad \partial_{x'}(\rho u'^2 + p) = 0, \quad \partial_{x'}[u'(\rho E + p)] = 0$$

$$\partial_{x'} \lambda = \frac{K \rho (1 - \lambda) \exp(-E_A^* \rho / p)}{\rho u'}$$

gives for  $\lambda$ , the mass fraction of the product  $B$ ,

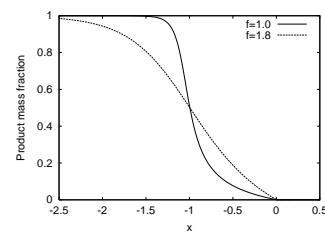

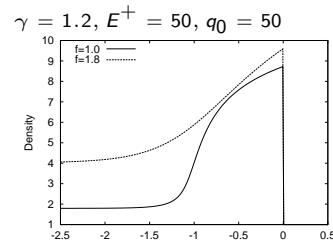

$$\frac{d\lambda}{dx'} = K(1 - \lambda) \exp\left(\frac{-E_A^* \rho(\lambda)/p(\lambda)}{u'(\lambda) + D}\right) = f(\lambda),$$

$$\text{i.e. } \int_0^{x'} f(\lambda(\xi)) d\xi = \lambda(x').$$

$D_{CJ}$  is the minimal detonation velocity. The overdrive-parameter  $f = (D/D_{CJ})^2 \geq 1$  determines stability.

Normalization:

$$L_{1/2} = \int_0^{\frac{1}{2}} \frac{d\lambda}{f(\lambda)}$$

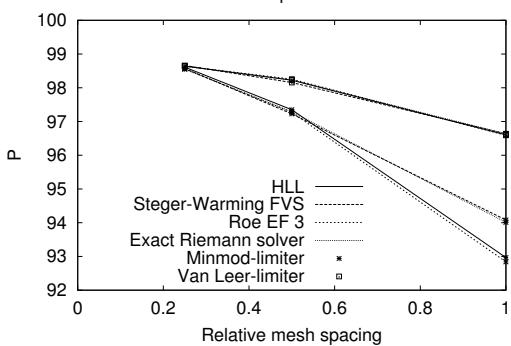

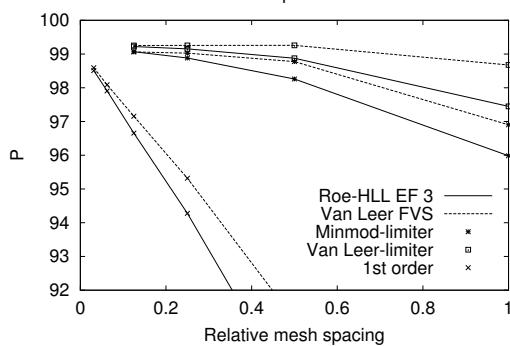

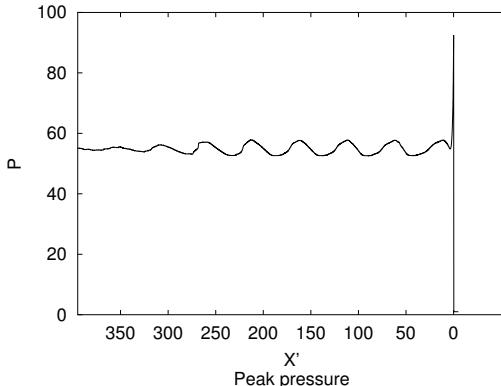

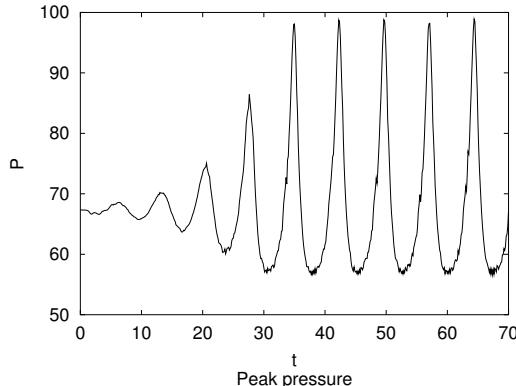

# Unstable ZND Detonation

 $\gamma = 1.2, E^+ = 50, q_0 = 50, f = 1.6, CFL = 0.9$

# Detonations - motivation for SAMR

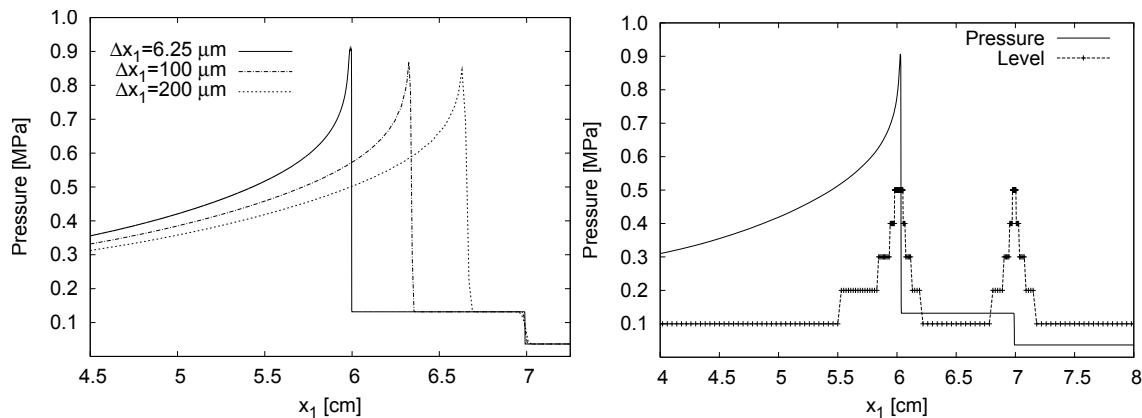

- ▶ Extremely high spatial resolution in reaction zone necessary.
- ▶ Minimal spatial resolution:  $7 - 8 \text{ Pts}/l_{ig} \rightarrow \Delta x_1 \approx 0.2 - 0.175 \text{ mm}$
- ▶ Uniform grids for typical geometries:  $> 10^7 \text{ Pts}$  in 2D,  $> 10^9 \text{ Pts}$  in 3D  $\rightarrow$  Self-adaptive finite volume method (AMR)

Approximation of H<sub>2</sub> : O<sub>2</sub> detonation at  $\sim 1.5 \text{ Pts}/l_{ig}$  (left) and  $\sim 24 \text{ Pts}/l_{ig}$  (right)

# Detonation ignition in a shock tube

- ▶ Shock-induced detonation ignition of  $\text{H}_2 : \text{O}_2 : \text{Ar}$  mixture at molar ratios 2:1:7 in closed 1d shock tube
- ▶ Insufficient resolution leads to inaccurate results
- ▶ Reflected shock is captured correctly by FV scheme, detonation is resolution dependent
- ▶ Fine mesh necessary in the induction zone at the head of the detonation

Left: Comparison of pressure distribution  $t = 170 \mu\text{s}$  after shock reflection. Right: Domains of refinement levels

## Detonation simulation

Course *Block-structured Adaptive Finite Volume Methods in C++*

Ralf Deiterding  
University of Southampton  
Engineering and the Environment  
Highfield Campus, Southampton SO17 1BJ, UK

E-mail: r.deiterding@soton.ac.uk

# Outline

## Detonation simulation

Detonation structures

## Combustion with viscous terms

Combustion induced by projectiles

Finite volume scheme

## Higher order schemes

Hybrid methods

# Planar ZND Structure

Steady situation under Galilean transformation:

$$\frac{\partial}{\partial x'}(\rho u') = 0$$

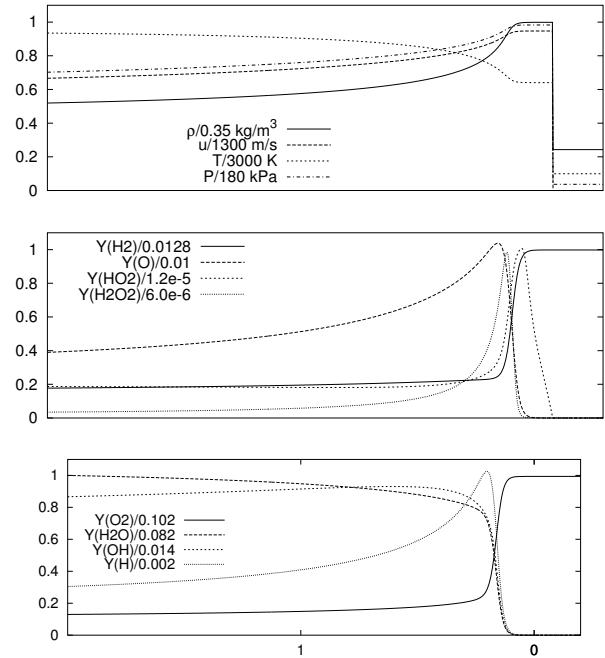

$$\frac{\partial}{\partial x'}(\rho u'^2 + p) = 0$$

$$\frac{\partial}{\partial x'}(u' \rho H) = 0$$

$$\frac{\partial Y_i}{\partial x'} = \frac{W_i \dot{\omega}_i \left( \rho \frac{Y_1}{W_1}, \dots, \rho \frac{Y_K}{W_K}, T \right)}{\rho u'}$$

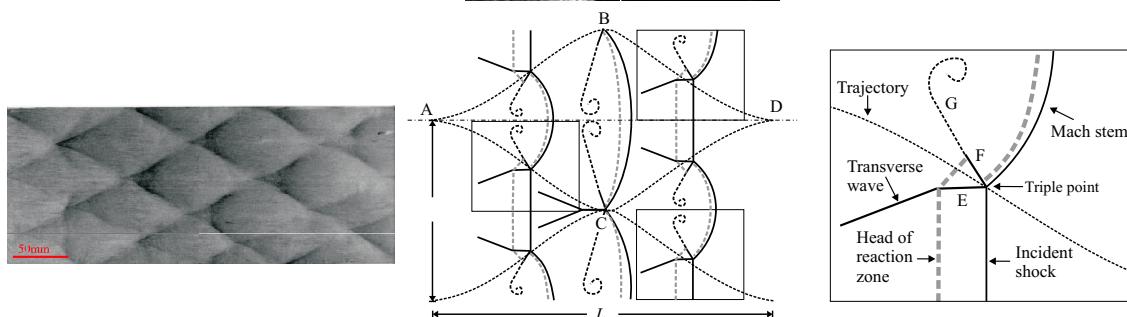

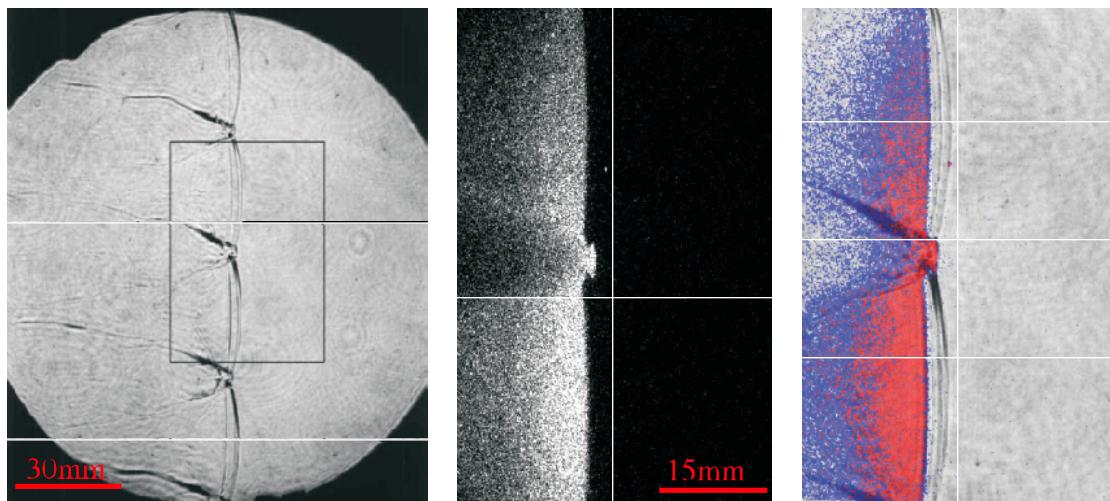

CJ-detonation of  $\text{H}_2 : \text{O}_2 : \text{Ar}$  with molar ratios 2 : 1 : 7 at  $T_0 = 298 \text{ K}$  and  $p_0 = 6.67 \text{ kPa}$ ,  $d_{CJ} \approx 1627 \text{ m/s}$ .

$t_{ig} \approx 3.55 \mu\text{s}$ ,  $u'_{vN} \approx 395.5 \text{ m/s}$ ,  $I_{ig} \approx 0.14 \text{ cm}$ .

# Detonation cell structure in 2D - Regular instability

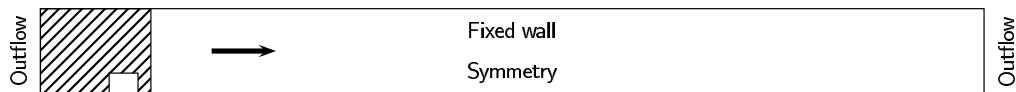

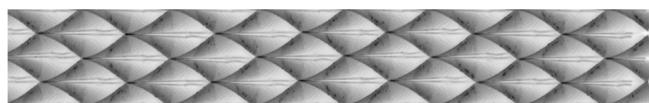

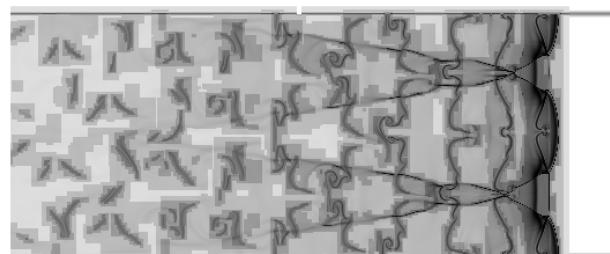

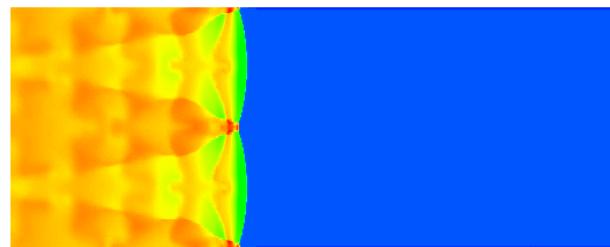

E: Reflected shock. F: Slip line. G: Diffusive extension of slip line.

# Transverse detonation structure - irregular instability

# Simulation of regular structures

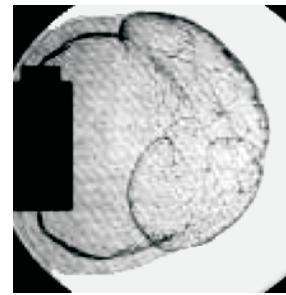

- ▶ CJ detonation for  $\text{H}_2 : \text{O}_2 : \text{Ar}$  (2:1:7) at  $T_0 = 298 \text{ K}$  and  $p_0 = 10 \text{ kPa}$ , cell width 1.6 cm
- ▶ Perturb 1d ZND solution with unreacted high-pressure pocket behind front
- ▶ Triple point trajectories by tracking  $\max |\omega|$  on auxiliary mesh shifted through grid with CJ velocity.  $\omega = \frac{\partial v}{\partial x} - \frac{\partial u}{\partial y}$
- ▶ SAMR simulation with 4 additional levels (2,2,2,4), 67.6 Pts/ $l_{ig}$
- ▶ Configuration similar to Oran et al., J. Combustion and Flame 113, 1998.

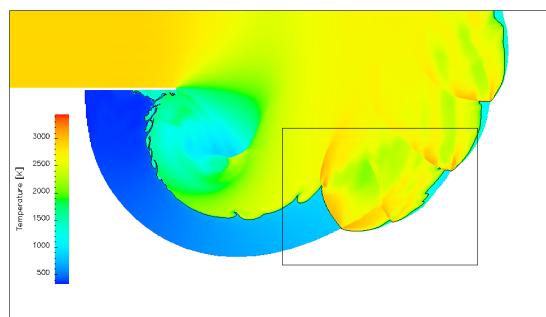

[code/amroc/doc/html/apps/clawpack\\_2applications\\_2euler\\_1\\_chem\\_22d\\_2StrehlowH202\\_2StatDet\\_2src\\_2Problem\\_8h\\_source](http://code/amroc/doc/html/apps/clawpack_2applications_2euler_1_chem_22d_2StrehlowH202_2StatDet_2src_2Problem_8h_source).

# Detonation diffraction

- ▶ CJ detonation for  
 $H_2 : O_2 : Ar/2 : 1 : 7$  at  
 $T_0 = 298 \text{ K}$  and  $p_0 = 10 \text{ kPa}$ .  
 Cell width  $\lambda_c = 1.6 \text{ cm}$
- ▶ Adaption criteria (similar as before):
  1. Scaled gradients of  $\rho$  and  $p$
  2. Error estimation in  $Y_i$  by Richardson extrapolation
- ▶ 25 Pts/ $l_{ig}$ . 5 refinement levels (2,2,2,4).
- ▶ Adaptive computations use up to  $\sim 2.2 \text{ M}$  instead of  $\sim 150 \text{ M}$  cells (uniform grid)
- ▶  $\sim 3850 \text{ h}$  CPU ( $\sim 80 \text{ h}$  real time) on 48 nodes Athlon 1.4GHz

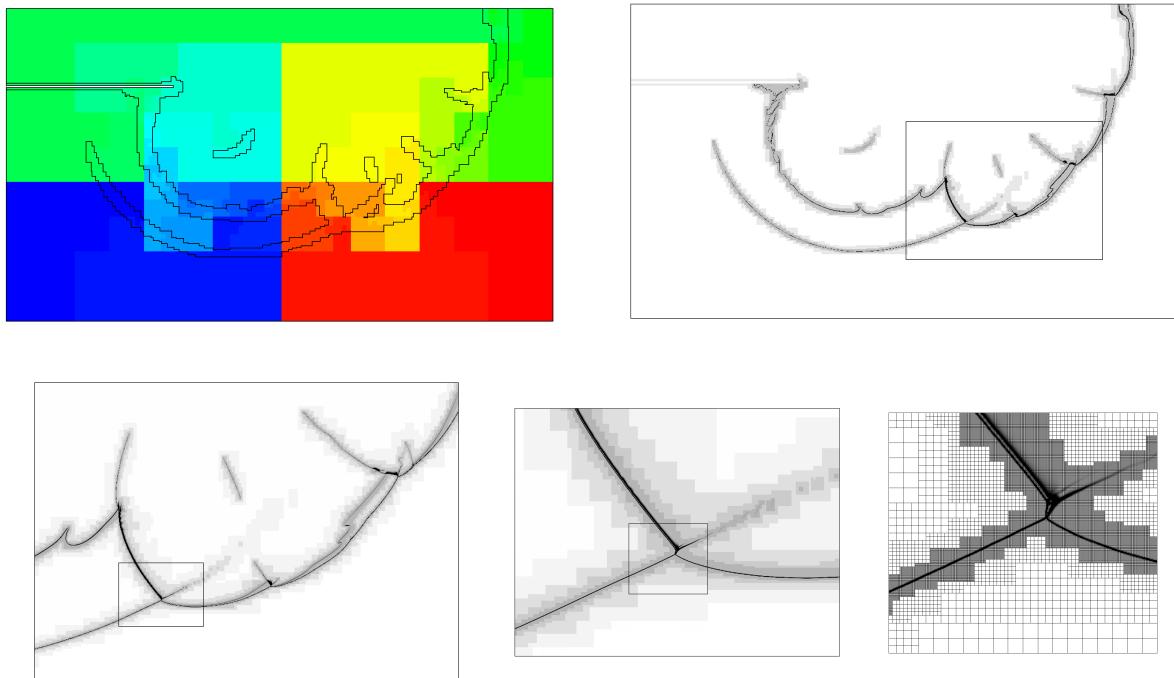

E. Schultz. *Detonation diffraction through an abrupt area expansion*. PhD thesis, California Institute of Technology, Pasadena, California, April 2000.

# Detonation diffraction - adaptation

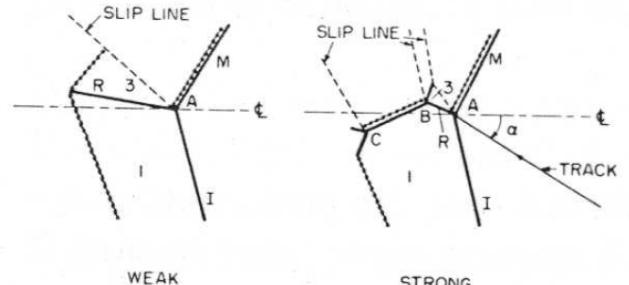

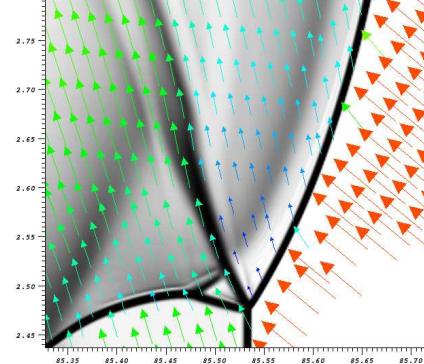

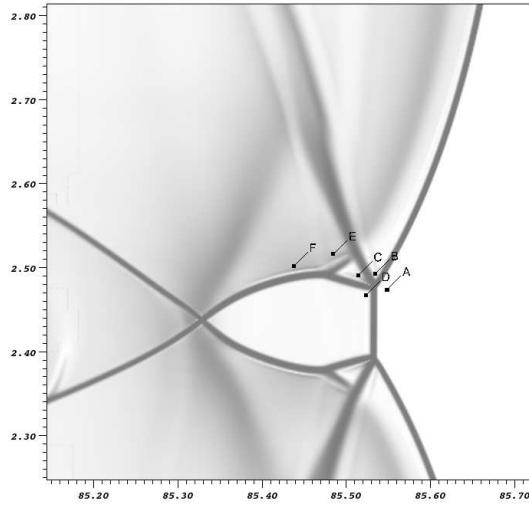

Final distribution to 48 nodes and density distribution on four refinement levels

[code/amroc/doc/html/apps/clawpack\\_2applications\\_2euler\\_\\_chem\\_22d\\_2Diffraction\\_2src\\_2Problem\\_8h\\_source.html](code/amroc/doc/html/apps/clawpack_2applications_2euler__chem_22d_2Diffraction_2src_2Problem_8h_source.html)

# Triple point analysis

Double Mach reflection structure shortly before the next collision

	$p/p_0$	$\rho/\rho_0$	$T [K]$	$u[m/s]$	$M$
A	1.00	1.00	298	1775	5.078
B	31.45	4.17	2248	447	0.477
C	31.69	5.32	1775	965	1.153
D	19.17	3.84	1487	1178	1.533
E	35.61	5.72	1856	901	1.053
F	40.61	6.09	1987	777	0.880

# Shock polar analysis of triple points in detonations

- ▶ Neglect reaction, but consider  $c_{pi}(T)$
- ▶ Data extracted point-wise from simulation
- ▶ Primary triple point  $T$  travels exactly at tip of Mach stem → use oblique shock relations between  $A$  and  $B$

$$\begin{aligned}\rho_A u_A \sin(\phi_B) &= \rho_B u_B \sin(\phi_B - \theta_B), \\ \rho_A + \rho_A u_A^2 \sin^2(\phi_B) &= \rho_B + \rho_B u_B^2 \sin^2(\phi_B - \theta_B)\end{aligned}$$

to evaluate inflow velocity as  $u_A = \frac{1}{\sin \phi_B} \sqrt{\frac{\rho_B(p_B - p_A)}{\rho_A(\rho_B - \rho_A)}}$

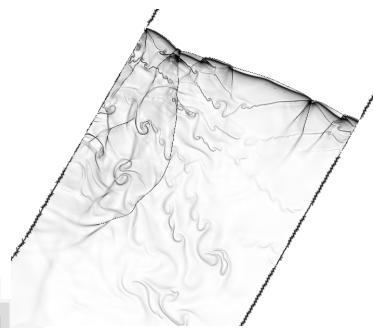

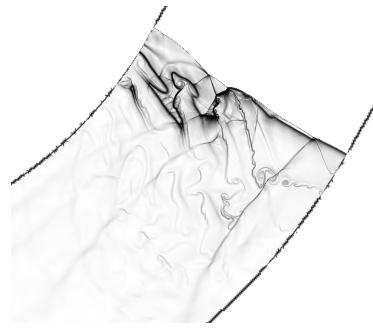

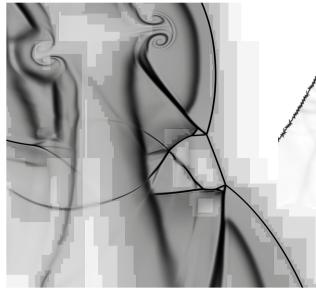

- ▶ Measure inflow angle  $\phi_B$  between Mach stem and triple point trajectory
- ▶ Velocity  $a$  of  $T'$  relative to  $T$  cannot be derived that easily: Oblique shock relations across  $C$  and  $D$  hold true both in frame of reference for  $T$  and  $T'$

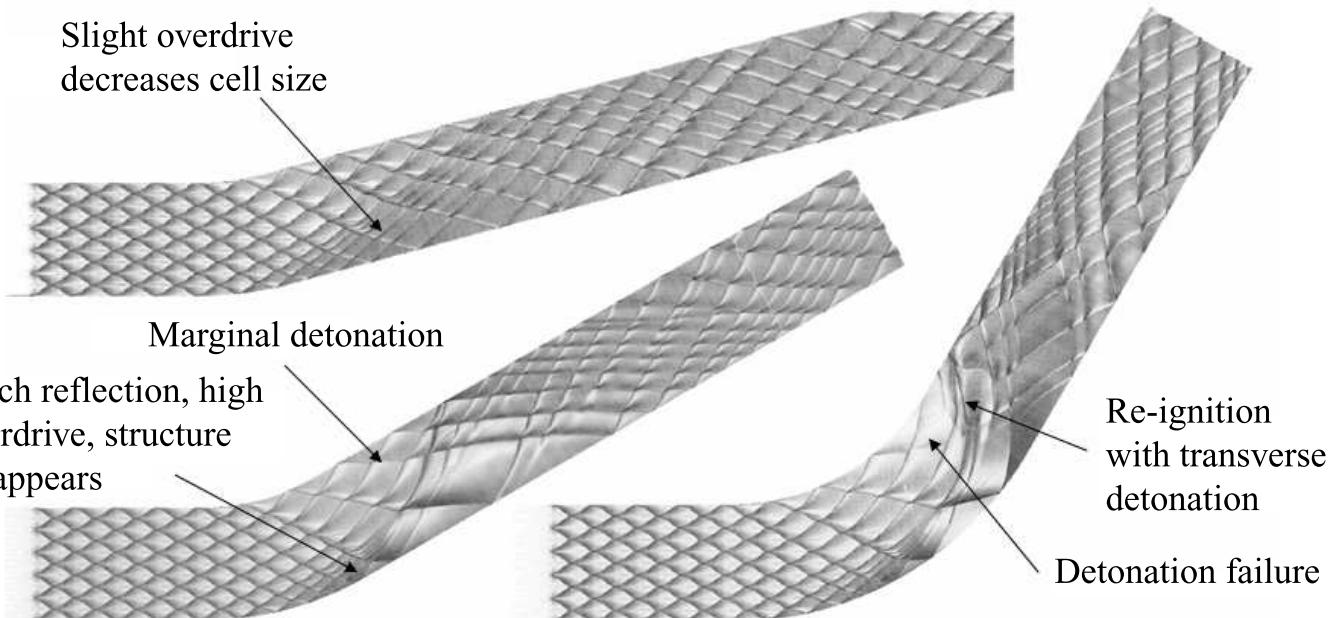

$$\begin{aligned}\rho_C (u_{C,n} - a_n) &= \rho_D (u_{D,n} - a_n) \\ \rho_C + \rho_C (u_{C,n} - a_n)^2 &= \rho_D + \rho_D (u_{D,n} - a_n)^2 \quad \rightarrow a_n = 0, a_t \text{ arbitrary} \\ u_{C,t} - a_t &= u_{D,t} - a_t \\ h_C + \frac{1}{2} (u_{C,n} - a_n)^2 &= h_D + \frac{1}{2} (u_{D,n} - a_n)^2 \quad \text{Estimate } a_t = \frac{L_R}{t_{\text{init}}}\end{aligned}$$

# Detonation propagation through pipe bends

- ▶ 2D Simulation of CJ detonation for  $H_2 : O_2 : Ar/2 : 1 : 7$  at  $T_0 = 298 K$  and  $p_0 = 10 kPa$ . Tube width of 5 detonation cells
- ▶ AMR base grid  $1200 \times 992$ . 4 additional refinement levels ( $2,2,2,4$ ).  $67.6 \text{ Pts}/l_{ig}$
- ▶ Adaptive computations use up to  $7.1 \cdot 10^6$  cells ( $4.8 \cdot 10^6$  on highest level) instead of  $1.22 \cdot 10^9$  cells (uniform grid)
- ▶  $\sim 70,000$  h CPU on 128 CPUs Pentium-4 2.2GHz

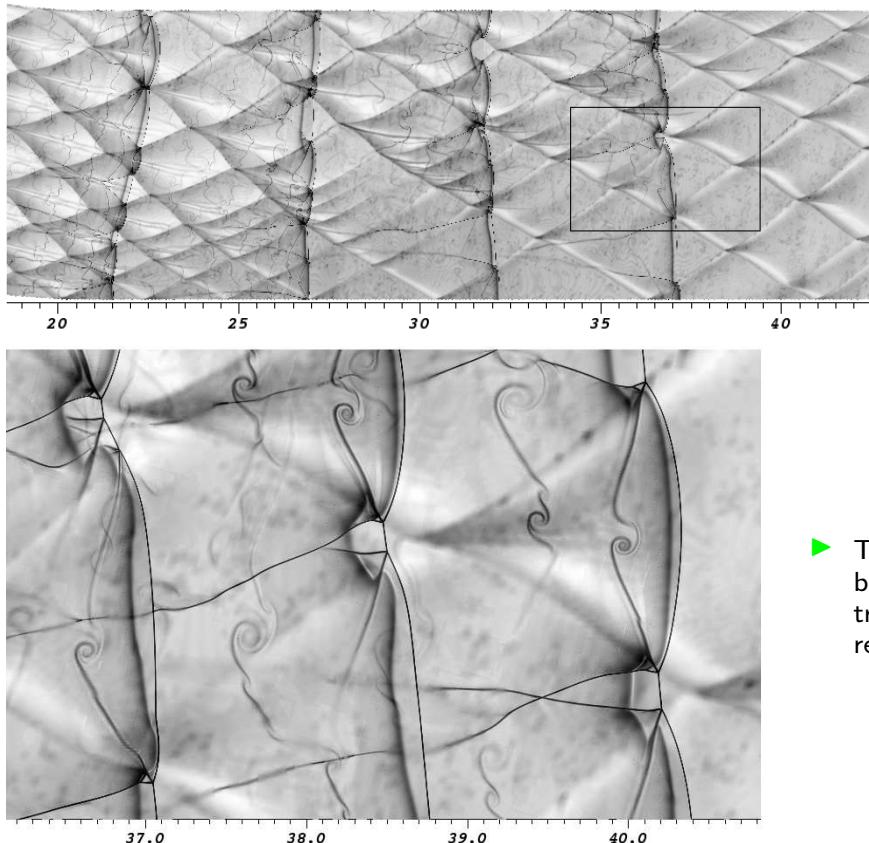

## Triple point tracks

$\varphi = 15^\circ$  (left, top),  $\varphi = 30^\circ$  (left, bottom), and  $\varphi = 60^\circ$  (right)

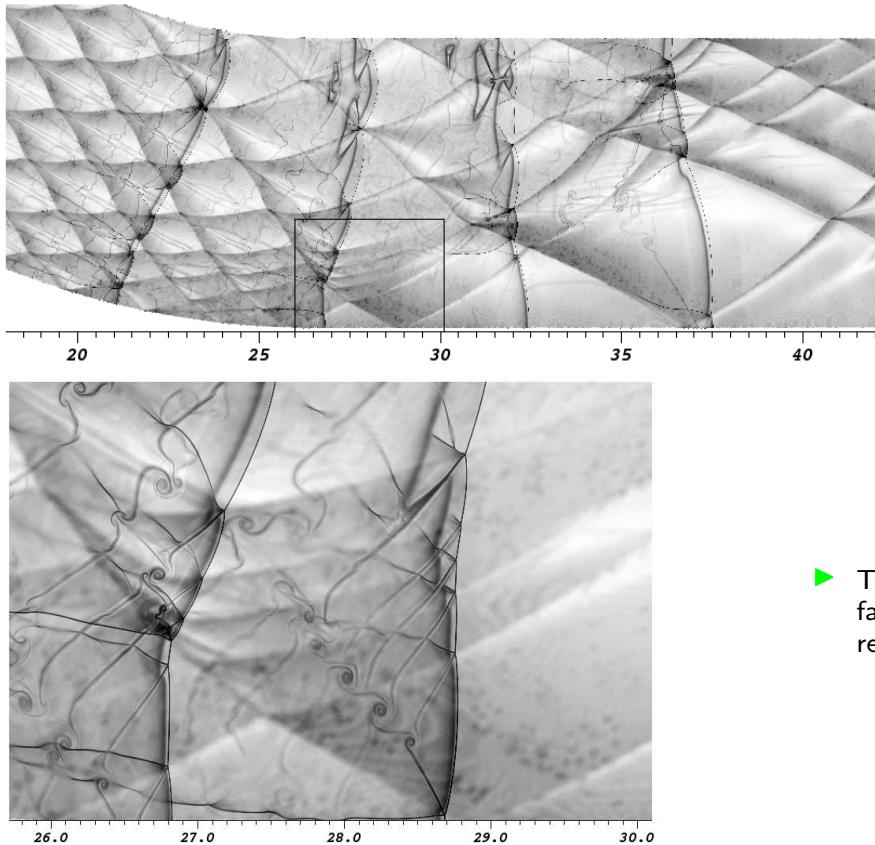

[code/amroc/doc/html/apps/clawpack\\_2applications\\_2euler\\_\\_chem\\_22d\\_2PipeBend\\_2src\\_2Problem\\_8h\\_source.html](code/amroc/doc/html/apps/clawpack_2applications_2euler__chem_22d_2PipeBend_2src_2Problem_8h_source.html)

## Triple point structures – $\varphi = 15^\circ$

- ▶ Triple point re-initiation after bend with change from transitional to Double Mach reflection

## Triple point structures – $\varphi = 30^\circ$

- ▶ Triple point quenching and failure as single Mach reflection

## Transition criteria

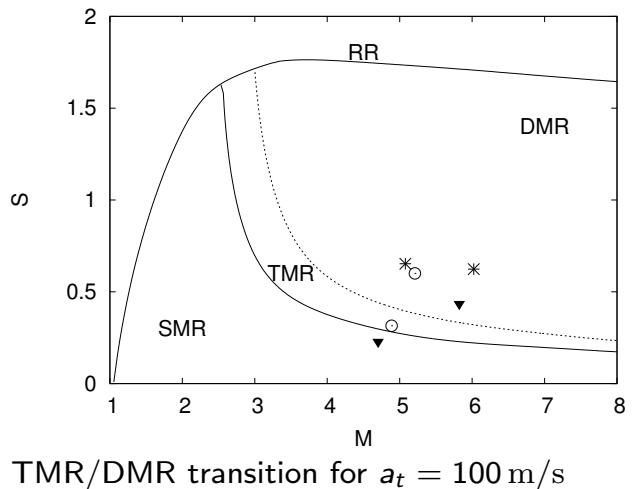

Solve system of oblique shock relations numerically and determine transition boundaries [Ben-Dor, 2007].

- ▶ Regular reflection (RR):  $M_B^T < 1$
- ▶ Single Mach reflection (SMR):  $M_C^T < 1$  and  $M_B^T > 1$
- ▶ Transitional Mach reflection:  $M_C^{T'} < 1$  and  $M_C^T > 1$
- ▶ Double Mach reflection:  $M_C^{T'} > 1$  and  $M_C^T > 1$
- ▶ Here: Nonreactive  $\text{H}_2 : \text{O}_2 : \text{Ar}$  mixture at initially 298 K and 10 kPa

For detonations:

$$S := \frac{p_C - p_D}{p_D}$$

[Deiterding, 2011]

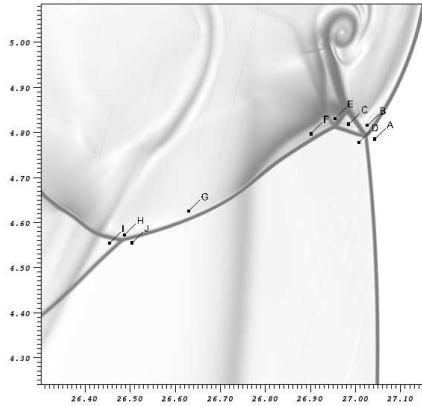

TMR/DMR transition for  $a_t = 100 \text{ m/s}$

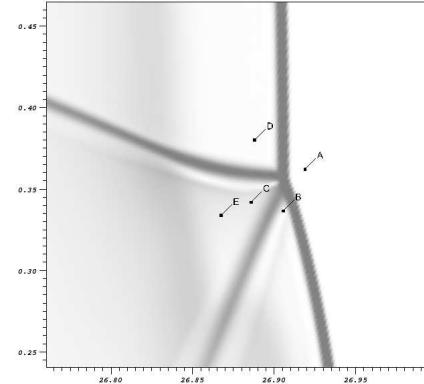

- ▶ Non-reactive shock wave reflection theory seems applicable to predict local triple point structure and stability
- ▶ Triple point type is determined solely by  $S$  and  $M$ . Useful to determine type in underresolved situations.

# Triple point structures, $\varphi = 15$

Strong DMR structure in diffraction region behind bend,  
 $S = 1.062$

TMR structure in compression region shortly behind bend,  $S = 0.338$

# Detonation cell structure in 3D

- ▶ Simulation of only one quadrant
- ▶  $44.8 \text{ Pts}/l_g$  for  $\text{H}_2 : \text{O}_2 : \text{Ar}$  CJ detonation
- ▶ SAMR base grid  $400 \times 24 \times 24$ , 2 additional refinement levels (2, 4)
- ▶ Simulation uses  $\sim 18 \text{ M}$  cells instead of  $\sim 118 \text{ M}$  (unigrid)
- ▶  $\sim 51,000 \text{ h}$  CPU on 128 CPU Compaq Alpha.  
 $\mathcal{H}: 37.6\%, \mathcal{S}: 25.1\%$

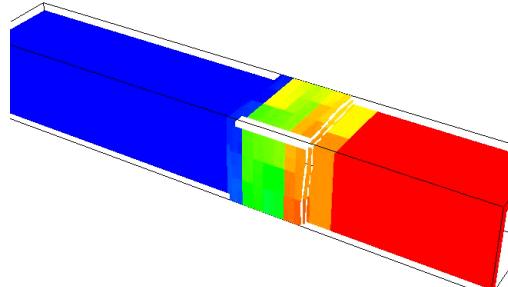

Schlieren on refinement levels

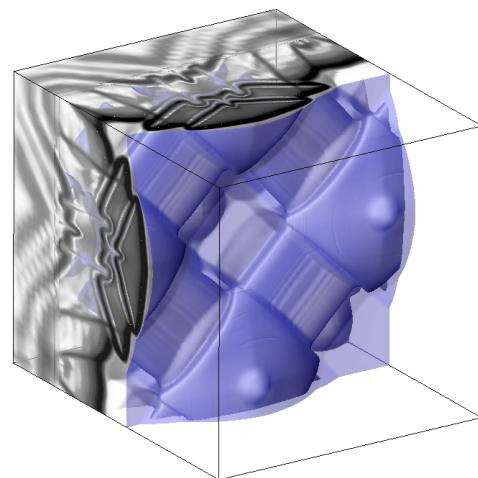

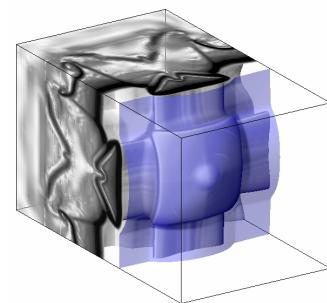

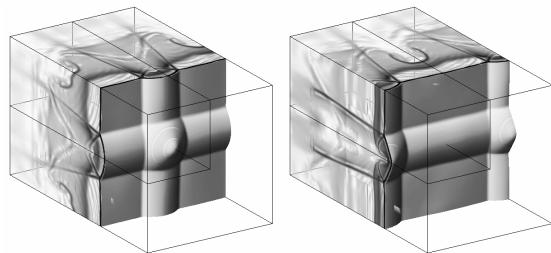

Schlieren and isosurface of  $Y_{\text{OH}}$

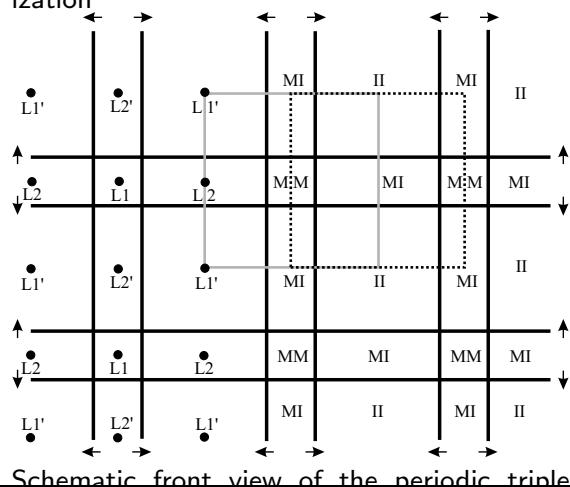

Distribution to 128 processors

## Detonation cell structure in 3D - II

Schlieren plots of density, mirrored for visualization

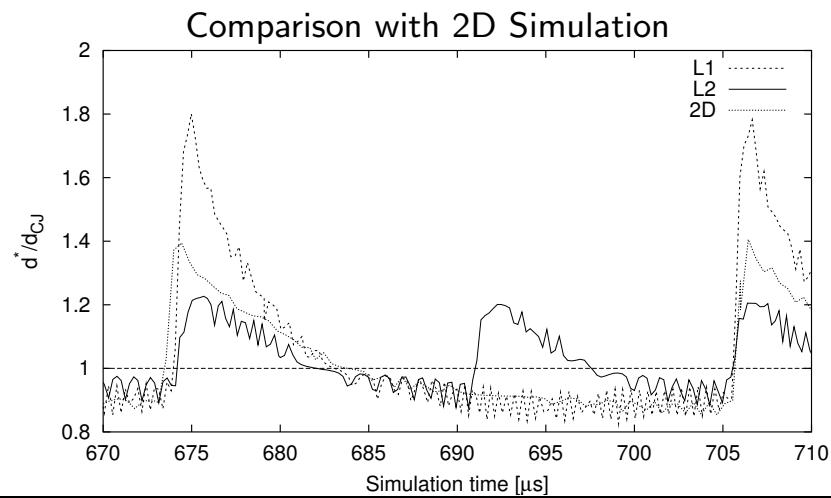

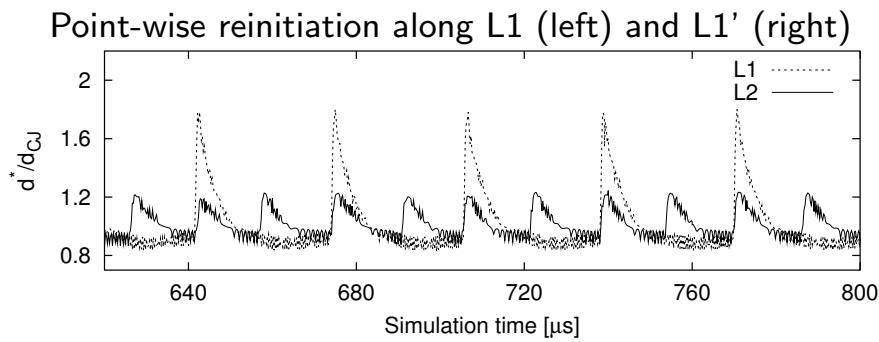

Detonation simulation

Schlieren plots of  $Y_{OH}$

[code/amroc/doc/html/apps/clawpack\\_2applications\\_2euler\\_\\_chem\\_23d\\_2StrehlowH202\\_2StatDet\\_2src\\_2Problem\\_8h\\_source.html](http://code/amroc/doc/html/apps/clawpack_2applications_2euler__chem_23d_2StrehlowH202_2StatDet_2src_2Problem_8h_source.html)

# Temporal Development of Detonation Velocity

## Axisymmetric Navier-Stokes equations with chemical reaction

$$\frac{\partial \mathbf{q}}{\partial t} + \frac{\partial(\mathbf{f} - \mathbf{f}_v)}{\partial x} + \frac{\partial(\mathbf{g} - \mathbf{g}_v)}{\partial y} = \frac{\alpha}{y}(\mathbf{c} - \mathbf{g} + \mathbf{g}_v) + \mathbf{s}$$

$$\mathbf{q} = \begin{bmatrix} \rho_i \\ \rho u \\ \rho v \\ \rho E \end{bmatrix}, \quad \mathbf{f} = \begin{bmatrix} \rho_i u \\ \rho u^2 + p \\ \rho u v \\ u(\rho E + p) \end{bmatrix}, \quad \mathbf{g} = \begin{bmatrix} \rho_i v \\ \rho u v \\ \rho v^2 + p \\ v(\rho E + p) \end{bmatrix}, \quad \mathbf{c} = \begin{bmatrix} 0 \\ 0 \\ p - \tau_{\theta\theta} \\ 0 \end{bmatrix}, \quad \mathbf{s} = \begin{bmatrix} \dot{\omega}_i \\ 0 \\ 0 \\ 0 \end{bmatrix}$$

$$\mathbf{f}_v = \begin{bmatrix} \rho D_i \frac{\partial Y_i}{\partial x} \\ \tau_{xx} \\ \tau_{xy} \\ k \frac{\partial T}{\partial x} + \rho \sum h_j D_j \frac{\partial Y_j}{\partial x} + u \tau_{xx} + v \tau_{xy} \end{bmatrix} \quad \begin{aligned} \tau_{xx} &= -\frac{2}{3}\mu(\nabla \cdot \mathbf{v}) + 2\mu \frac{\partial u}{\partial x} \\ \tau_{yy} &= -\frac{2}{3}\mu(\nabla \cdot \mathbf{v}) + 2\mu \frac{\partial v}{\partial y} \\ \tau_{\theta\theta} &= -\frac{2}{3}\mu(\nabla \cdot \mathbf{v}) + 2\mu \frac{v}{y} \\ \tau_{xy} &= \mu \left( \frac{\partial u}{\partial y} + \frac{\partial v}{\partial x} \right) \\ \nabla \cdot \mathbf{v} &= \left( \frac{\partial u}{\partial x} + \frac{\partial v}{\partial y} + \alpha \frac{v}{y} \right) \end{aligned}$$

$$\mathbf{g}_v = \begin{bmatrix} \rho D_i \frac{\partial Y_i}{\partial y} \\ \tau_{xy} \\ \tau_{yy} \\ k \frac{\partial T}{\partial y} + \rho \sum h_j D_j \frac{\partial Y_j}{\partial y} + u \tau_{xy} + v \tau_{yy} \end{bmatrix}$$

# Chemistry and transport properties

Arrhenius-kinetics:

$$\dot{\omega}_i = \sum_{j=1}^M (\nu_{ji}^r - \nu_{ji}^f) \left[ k_j^f \prod_{n=1}^K \left( \frac{\rho_n}{W_n} \right)^{\nu_{jn}^f} - k_j^r \prod_{n=1}^K \left( \frac{\rho_n}{W_n} \right)^{\nu_{jn}^r} \right] \quad i = 1, \dots, K$$

- ▶ Parsing of mechanisms and evaluation of  $\dot{\omega}_i$  with Chemkin-II
- ▶  $c_{pi}(T)$  and  $h_i(T)$  tabulated, linear interpolation between values

Mixture viscosity  $\mu = \mu(T, Y_i)$  with Wilke formula

$$\mu = \sum_{i=1}^K \frac{Y_i \mu_i}{W_i \sum_{m=1}^K Y_m \Phi_{im} / W_m} \text{ with } \Phi_{im} = \frac{1}{\sqrt{8}} \left( 1 + \frac{W_i}{W_m} \right)^{-\frac{1}{2}} \left( 1 + \left( \frac{\mu_i}{\mu_m} \right)^{\frac{1}{2}} \left( \frac{W_m}{W_i} \right)^{\frac{1}{4}} \right)^2$$

Mixture thermal conductivity  $k = k(T, Y_i)$  following Mathur

$$k = \frac{1}{2} \left( W \sum_{i=1}^K \frac{Y_i k_i}{W_i} + \frac{1}{W \sum_{i=1}^K Y_i / (W_i k_i)} \right)$$

Mixture diffusion coefficients  $D_i = D_i(T, p, Y_i)$  from binary diffusion  $D_{mi}(T, p)$  as

$$D_i = \frac{1 - Y_i}{W \sum_{m \neq i} Y_m / (W_m D_{mi})}$$

- ▶ Evaluation with Chemkin-II Transport library

## Splitting method

$$\partial_t \mathbf{q} + \partial_x (\mathbf{f} - \mathbf{f}_v) + \partial_y (\mathbf{g} - \mathbf{g}_v) = \frac{\alpha}{y} (\mathbf{c} - \mathbf{g} + \mathbf{g}_v) + \mathbf{s}$$

Dimensional splitting for PDE

$$\mathcal{X}^{(\Delta t)} : \quad \partial_t \mathbf{q} + \partial_x (\mathbf{f}(\mathbf{q}) - \mathbf{f}_v(\mathbf{q})) = 0 , \quad \text{IC: } \mathbf{Q}(t_m) \xrightarrow{\Delta t} \tilde{\mathbf{Q}}^{1/2}$$

$$\mathcal{Y}^{(\Delta t)} : \quad \partial_t \mathbf{q} + \partial_y (\mathbf{g}(\mathbf{q}) - \mathbf{g}_v(\mathbf{q})) = 0 , \quad \text{IC: } \tilde{\mathbf{Q}}^{1/2} \xrightarrow{\Delta t} \tilde{\mathbf{Q}}$$

Treat right-hand side as source term

$$\mathcal{C}^{(\Delta t)} : \quad \partial_t \mathbf{q} = \frac{\alpha}{y} (\mathbf{c}(\mathbf{q}) - \mathbf{g}(\mathbf{q}) + \mathbf{g}_v(\mathbf{q})) , \quad \text{IC: } \tilde{\mathbf{Q}} \xrightarrow{\Delta t} \bar{\mathbf{Q}}$$

Chemical source term

$$\mathcal{S}^{(\Delta t)} : \quad \partial_t \mathbf{q} = \mathbf{s}(\mathbf{q}) , \quad \text{IC: } \bar{\mathbf{Q}} \xrightarrow{\Delta t} \mathbf{Q}(t_m + \Delta t)$$

Formally 1st-order algorithm

$$\mathbf{Q}(t_m + \Delta t) = \mathcal{S}^{(\Delta t)} \mathcal{C}^{(\Delta t)} \mathcal{Y}^{(\Delta t)} \mathcal{X}^{(\Delta t)}(\mathbf{Q}(t_m))$$

but all sub-operators 2nd-order accurate or higher.

## Finite volume discretization

Time discretization  $t_n = n\Delta t$ , discrete volumes  $I_{jk} = [x_j - \frac{1}{2}\Delta x, x_j + \frac{1}{2}\Delta x] \times [y_k - \frac{1}{2}\Delta y, y_k + \frac{1}{2}\Delta y]$   $\times = [x_{j-1/2}, x_{j+1/2}] \times [y_{k-1/2}, y_{k+1/2}]$

Approximation  $\mathbf{Q}_{jk}(t) \approx \frac{1}{|I_{jk}|} \int_{I_{jk}} \mathbf{q}(\mathbf{x}, t) dx$  and numerical fluxes

$$\mathbf{F}(\mathbf{Q}_{jk}(t), \mathbf{Q}_{j+1,k}(t)) \approx \mathbf{f}(\mathbf{q}(x_{j+1/2}, y_k, t)),$$

$$\mathbf{F}_v(\mathbf{Q}_{jk}(t), \mathbf{Q}_{j+1,k}(t)) \approx \mathbf{f}_v(\mathbf{q}(x_{j+1/2}, y_k, t), \nabla \mathbf{q}(x_{j+1/2}, y_k, t))$$

yield (for simplicity)

$$\mathbf{Q}_{jk}^{n+1} = \mathbf{Q}_{jk}^n - \frac{\Delta t}{\Delta x} \left[ \mathbf{F}(\mathbf{Q}_{jk}^n, \mathbf{Q}_{j+1,k}^n) - \mathbf{F}(\mathbf{Q}_{j-1,k}^n, \mathbf{Q}_{jk}^n) \right] + \frac{\Delta t}{\Delta x} \left[ \mathbf{F}_v(\mathbf{Q}_{jk}^n, \mathbf{Q}_{j+1,k}^n) - \mathbf{F}_v(\mathbf{Q}_{j-1,k}^n, \mathbf{Q}_{jk}^n) \right]$$

- ▶ Riemann solver to approximate  $\mathbf{F}(\mathbf{Q}_{jk}^n, \mathbf{Q}_{j+1,k}^n)$
- ▶ 1st-order finite differences for  $\mathbf{F}_v(\mathbf{Q}_{jk}^n, \mathbf{Q}_{j+1,k}^n)$  yield 2nd-order accurate central differences in (\*)

Stability condition used:

$$\max_{i,j,k} \left\{ \frac{\Delta t}{\Delta x} (|u_{jk}| + c_{jk}) + \frac{8}{3} \frac{\mu_{jk} \Delta t}{\rho_{jk} \Delta x^2}, \frac{\Delta t}{\Delta x} (|u_{jk}| + c_{jk}) + \frac{2k_j \Delta t}{c_{v,jk} \rho_j \Delta x^2}, \frac{\Delta t}{\Delta x} (|u_{jk}| + c_{jk}) + D_{i,jk} \frac{\Delta t}{\Delta x^2} \right\} \leq 1$$

## Finite volume discretization – cont.

Symmetry source term  $\mathcal{C}^{(\Delta t)}$ : Use

$$\mathbf{Q}_{jk}^{n+1} = \mathbf{Q}_{jk}^n + \Delta t \left( \frac{\alpha}{y} (\mathbf{c}(\mathbf{Q}_{jk}^n) - \mathbf{g}(\mathbf{Q}_{jk}^n)) + \frac{1}{2} (\mathbf{G}_v(\mathbf{Q}_{jk}^n, \mathbf{Q}_{j,k+1}^n) + \mathbf{G}_v(\mathbf{Q}_{j,k-1}^n, \mathbf{Q}_{jk}^n)) \right)$$

within explicit 2nd-order accurate Runge-Kutta method

- ▶ Gives 2nd-order central difference approximation of  $\mathbf{G}_v$
- ▶ Transport properties  $\mu, k, D_i$  are stored in vector of state  $\mathbf{Q}$  and kept constant throughout entire time step

Chemical source term  $\mathcal{S}^{(\cdot)}$ :

- ▶ 4th-order accurate semi-implicit ODE-solver subcycles within each cell
- ▶  $\rho, e, u, v$  remain unchanged!

$$\partial_t \rho_i = W_i \dot{\omega}_i(\rho_1, \dots, \rho_K, T) \quad i = 1, \dots, K$$

## Lehr's ballistic range experiments

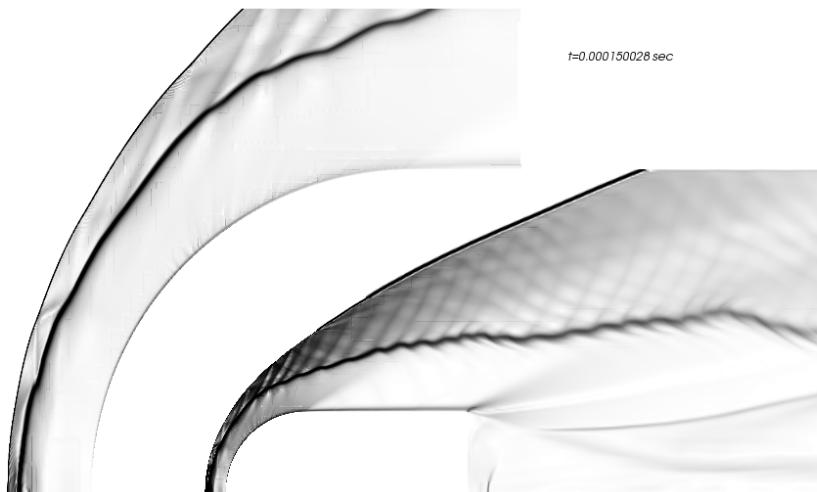

- ▶ Spherical-nosed projectile of radius 1.5 mm travels with constant velocity through stoichiometric H<sub>2</sub> : O<sub>2</sub> : N<sub>2</sub> mixture (molar ratios 2:1:3.76) at 42.663 kPa and  $T = 293$  K [Lehr, 1972]
- ▶ Mechanism by [Jachimowski, 1988]: 19 equilibrium reactions, 9 species. Chapman Jouguet velocity  $\sim 1957$  m/s.
- ▶ Axisymmetric Navier-Stokes and Eulers simulations on AMR base mesh of 400 × 200 cells, physical domain size 6 cm × 3 cm
- ▶ 4-level computations with refinement factors 2,2,4 to final time  $t = 170 \mu\text{s}$ . Refinement downstream removed.
- ▶ Main configurations
  - ▶ Velocity  $v_i = 1931$  m/s ( $M = 4.79$ ),  $\sim 40$  Pts/ $l_{ig}$
  - ▶ Velocity  $v_i = 1806$  m/s ( $M = 4.48$ ),  $\sim 60$  Pts/ $l_{ig}$
- ▶ Various previous studies with not entirely consistent results. E.g. [Yungster and Radhakrishnan, 1996], [Axdahl et al., 2011]
- ▶ Stagnation point location and pressure tracked in every time step
- ▶ All computations were on 32 cores requiring  $\sim 1500$  h CPU each

- ▶ Oscillation created by accelerated reaction due to slip line from previous triple point

## Inviscid case – $M = 4.48$

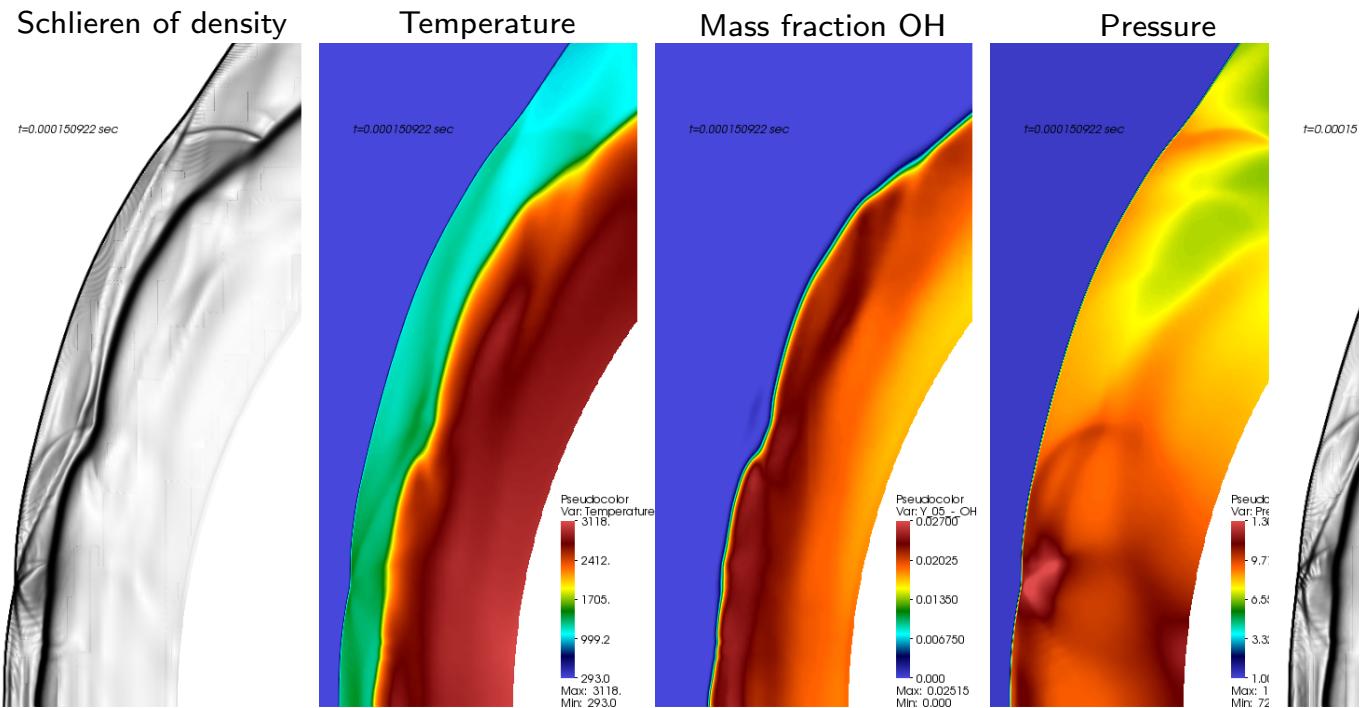

- ▶ 4048 iterations with CFL=0.9 to  $t = 170 \mu\text{s}$
- ▶ Oscillation frequency in last 20  $\mu\text{s}$ :  $\sim 395 \text{ kHz}$
- ▶ Experimental value:  $\sim 425 \text{ kHz}$

Schlieren plot of density

# Perturbed oscillation mechanism

- ▶ Small perturbations can quickly create numerous triple points

# Hybrid method

Convective numerical flux is defined as

$$\mathbf{F}_{inv}^n = \begin{cases} \mathbf{F}_{inv-WENO}^n, & \text{in } \mathcal{C} \\ \mathbf{F}_{inv-CD}^n, & \text{in } \bar{\mathcal{C}}, \end{cases}$$

- ▶ For LES: 3rd order WENO method, 2nd order TCD [Hill and Pullin, 2004]
- ▶ For DNS: Symmetric 6th order WENO, 6th-order CD scheme [Ziegler et al., 2011]

Use WENO scheme to only capture shock waves but resolve interface between species.

Shock detection based on using two criteria together:

1. Lax-Liu entropy condition  $|u_R \pm a_R| < |u_* \pm a_*| < |u_L \pm a_L|$  tested with a threshold to eliminate weak acoustic waves. Used intermediate states at cell interfaces:

$$u_* = \frac{\sqrt{\rho_L u_L} + \sqrt{\rho_R u_R}}{\sqrt{\rho_L} + \sqrt{\rho_R}}, \quad a_* = \sqrt{(\gamma_* - 1)(h_* - \frac{1}{2} u_*^2)}, \dots$$

2. Limiter-inspired discontinuity test based on mapped normalized pressure gradient  $\theta_j$

$$\phi(\theta_j) = \frac{2\theta_j}{(1 + \theta_j)^2} \quad \text{with} \quad \theta_j = \frac{|p_{j+1} - p_j|}{|p_{j+1} + p_j|}, \quad \phi(\theta_j) > \alpha_{Map}$$

# SAMR flux correction for Runge-Kutta method

Recall Runge-Kutta temporal update

$$\tilde{\mathbf{Q}}_j^v = \alpha_v \mathbf{Q}_j^m + \beta_v \tilde{\mathbf{Q}}_j^{v-1} + \gamma_v \frac{\Delta t}{\Delta x_n} \Delta \mathbf{F}^n(\tilde{\mathbf{Q}}^{v-1})$$

rewrite scheme as

$$\mathbf{Q}^{m+1} = \mathbf{Q}^m - \sum_{v=1}^r \varphi_v \frac{\Delta t}{\Delta x_n} \Delta \mathbf{F}^n(\tilde{\mathbf{Q}}^{v-1}) \quad \text{with} \quad \varphi_v = \gamma_v \prod_{\nu=v+1}^r \beta_\nu$$

Flux correction to be used

1.  $\delta \mathbf{F}_{i-\frac{1}{2}, j}^{1, l+1} := -\varphi_1 \mathbf{F}_{i-\frac{1}{2}, j}^{1, l}(\tilde{\mathbf{Q}}^0), \quad \delta \mathbf{F}_{i-\frac{1}{2}, j}^{1, l+1} := \delta \mathbf{F}_{i-\frac{1}{2}, j}^{1, l+1} - \sum_{v=2}^r \varphi_v \mathbf{F}_{i-\frac{1}{2}, j}^{1, l}(\tilde{\mathbf{Q}}^{v-1})$
2.  $\delta \mathbf{F}_{i-\frac{1}{2}, j}^{1, l+1} := \delta \mathbf{F}_{i-\frac{1}{2}, j}^{1, l+1} + \frac{1}{r_{l+1}^2} \sum_{\ell=0}^{r_{l+1}-1} \sum_{v=1}^r \varphi_v \mathbf{F}_{v+\frac{1}{2}, w+\ell}^{1, l+1} (\tilde{\mathbf{Q}}^{v-1}(t + \kappa \Delta t_{l+1}))$

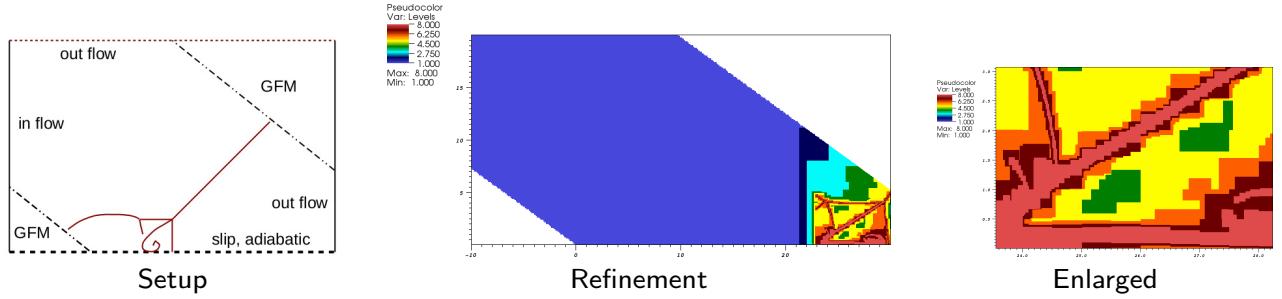

Storage-efficient SSPRK(3,3):

$v$	$\alpha_v$	$\beta_v$	$\gamma_v$	$\varphi_v$
1	1	0	1	$\frac{1}{6}$
2	$\frac{3}{4}$	$\frac{1}{4}$	$\frac{1}{4}$	$\frac{1}{8}$
3	$\frac{1}{2}$	$\frac{1}{3}$	$\frac{1}{3}$	$\frac{1}{3}$

[Pantano et al., 2007]

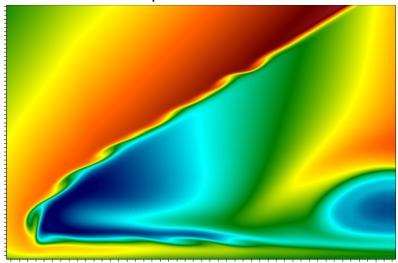

# DNS of shear layer in detonation triple point

- ▶ Calorically perfect two-species model with  $\gamma = 1.29499$  and  $h_0 = 54,000 \text{ J/mol}$  and one-step Arrhenius reaction with parameters  $E_a = 30,000 \text{ J/mol}$ ,  $A = 6 \cdot 10^5 \text{ s}^{-1}$ ,  $W = 0.029 \text{ kg/mol}$  → 1d ZND theory predicts  $d_{\text{CJ}} = 1587.8 \text{ m/s}$
- ▶ For dynamic viscosity, heat conductivity, and mass diffusion simple Sutherland models are used
- ▶ Distance  $L(t) = d_{\text{CJ}} \sin(\theta)t$  is used to define a Reynolds number as  $\text{Re} = \frac{\rho_0 a_0 L(t)}{\mu_0}$
- ▶ Viscous shear layer thickness, thermal heat conduction layer thickness, and mass diffusion layer thickness grow as  $\delta_{\text{visc}} \approx \sqrt{\frac{\mu}{\rho} t}$ ,  $\delta_{\text{cond}} \approx \sqrt{\frac{k_{\text{ref}}}{\rho c_v} t}$ ,  $\delta_{\text{mass},i} \approx \sqrt{\frac{D_i}{\rho} t}$
- ▶ Only shock thickness not resolved → “pseudo-DNS”
- ▶ Computations with WENO/CD/RK3 use SAMR base mesh  $320 \times 160$  and up to 8 levels refined by factor 2, domain:  $40 \text{ mm} \times 20 \text{ mm}$
- ▶ Computations with MUSCL scheme use base mesh  $590 \times 352$  and up to 7 levels refined by factor 2, domain:  $40 \text{ mm} \times 22 \text{ mm}$

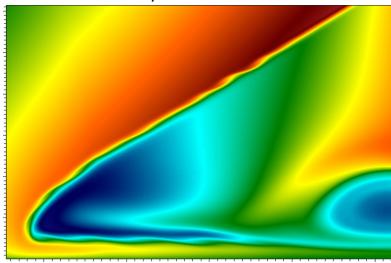

# Computational results for shear layer

WENO/CD - 6 levels

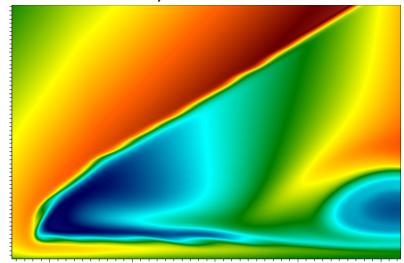

$$\Delta x_{\min} = 3.91 \cdot 10^{-6} \text{ m}$$

WENO/CD - 7 levels

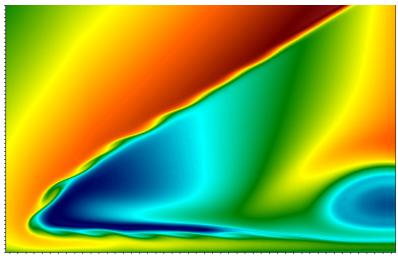

$$\Delta x_{\min} = 1.95 \cdot 10^{-6} \text{ m}$$

WENO/CD - 8 levels

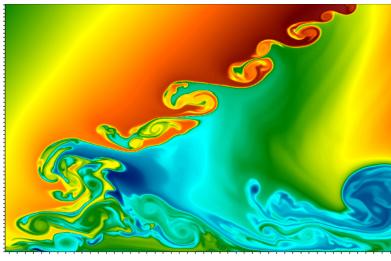

$$\Delta x_{\min} = 9.77 \cdot 10^{-7} \text{ m}$$

MUSCL - 7 levels

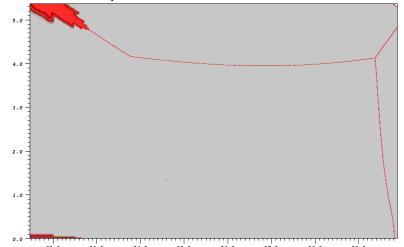

$$\Delta x_{\min} = 1.05 \cdot 10^{-6} \text{ m}$$

MUSCL - 7 levels - Euler

$$\Delta x_{\min} = 1.05 \cdot 10^{-6} \text{ m}$$

Usage of WENO for  
WENO/CD - 8 levels

- ▶ WENO/CD/RK3 gives results comparable to 4x finer resolved optimal 2nd-order scheme, but CPU times with SAMR 2-3x larger
- ▶ Gain in CPU time from higher-order scheme roughly one order

# Outline

## Fluid-structure interaction

- Coupling to a solid mechanics solver
- Implementation
- Rigid body motion
- Thin elastic and deforming thin structures
- Deformation from water hammer
- Real-world example

## Massively parallel SAMR

- Performance data from AMROC

# Outline

## Fluid-structure interaction

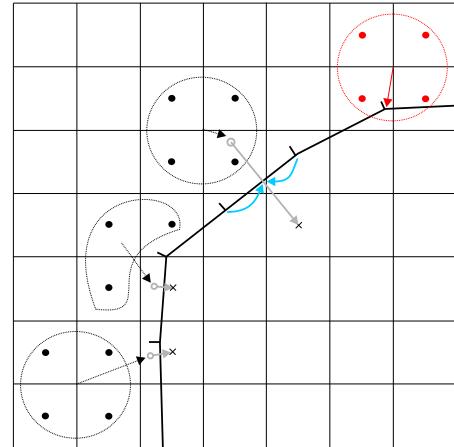

- Coupling to a solid mechanics solver
- Implementation
- Rigid body motion
- Thin elastic and deforming thin structures
- Deformation from water hammer
- Real-world example

## Massively parallel SAMR

- Performance data from AMROC

# Construction of coupling data

- ▶ Moving boundary/interface is treated as a moving contact discontinuity and represented by level set [Fedkiw, 2002][Arienti et al., 2003]
- ▶ Efficient construction of level set from triangulated surface data with closest-point-transform (CPT) algorithm [Mauch, 2003]
- ▶ One-sided construction of mirrored ghost cell and new nodal point values
- ▶ Gathering of solid force and momentum information and solution of equations of motion on central node
- ▶ Stable explicit coupling possible if geometry and velocities are prescribed for compressible fluid [Specht, 2000]

```

 $u_n^F := u_n^S(t)|_{\mathcal{I}}$ 
UpdateFluid( $\Delta t$ )
 $\sigma_{nm}^S := -p^F(t + \Delta t)\delta_{nm}|_{\mathcal{I}}$ 
UpdateSolid( $\Delta t$ )
 $t := t + \Delta t$ 

```

Coupling conditions on interface  
 Inviscid fluid (for FV methods):

$$\begin{aligned} u_n^S &= u_n^F \\ \sigma_{nm}^S &= -p^F \delta_{nm} \Big|_{\mathcal{I}} \end{aligned}$$

# Usage of SAMR

- ▶ Eulerian SAMR + non-adaptive Lagrangian FEM scheme
  - ▶ Exploit SAMR time step refinement for effective coupling to solid solver
    - ▶ Lagrangian simulation is called only at level  $l_c \leq l_{\max}$
    - ▶ SAMR refines solid boundary at least at level  $l_c$
    - ▶ Additional levels can be used resolve geometric ambiguities
  - ▶ Nevertheless: Inserting sub-steps accommodates for time step reduction from the solid solver within an SAMR cycle
  - ▶ Communication strategy:
    - ▶ Updated boundary info from solid solver must be received before regridding operation
    - ▶ Boundary data is sent to solid when highest level available
  - ▶ Inter-solver communication (point-to-point or globally) managed on the fly special coupling module

# SAMR algorithm for FSI coupling

AdvanceLevel()

Repeat  $r_l$  times

Set ghost cells of  $\mathbf{Q}'(t)$

$$\text{CPT}(\varphi^I, C^I, \mathcal{I}, \delta_I)$$

If time to regrid?

Regrid(I)

UpdateLevel()

If level  $l+1$  exists?

Set ghost cells of  $\mathbf{Q}'(t + \Delta t_l)$

AdvanceLevel( $l + 1$ )

Average  $\mathbf{Q}^{l+1}(t + \Delta t_l)$  onto  $\mathbf{Q}^l(t + \Delta t_l)$

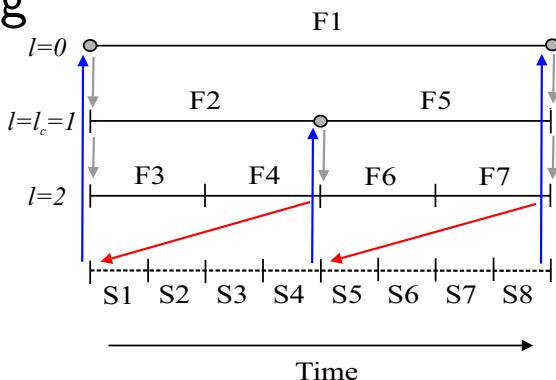

If  $I = I_c$ ?

**SendInterfaceData**( $p^F(t + \Delta t_l)|_{\tau}$ )

If  $(t + \Delta t_l) < (t_0 + \Delta t_0)$ ?

`ReceiveInterfaceData( $\mathcal{I}$ ,  $\mathbf{u}^S|_{\tau}$ )`

$$t := t + \Delta t_l$$

- ▶ Call CPT algorithm before Regrid(1)
  - ▶ Include also call to  $\text{CPT}(\cdot)$  into Recompose(1) to ensure consistent level set data on levels that have changed
  - ▶ Communicate boundary data on coupling level  $I_c$

## Fluid and solid update / exchange of time steps

FluidStep( )

$$\Delta\tau_F := \min_{I=0, \dots, I_{\max}} (\text{StableFluidTimeStep}(I), \Delta\tau_S)$$

```

 $\Delta t_l := \Delta \tau_F / R_l$  for  $l = 0, \dots, L$ 
ReceiveInterfaceData( $\mathcal{I}$ ,  $\mathbf{u}^S|_{\mathcal{I}}$ )
AdvanceLevel(0)

```

SolidStep( )

$$\Delta\tau_S := \min(K \cdot R_{l_c} \cdot \text{StableSolidTimeStep}(), \Delta\tau_E)$$

Repeat  $R_{I_c}$  times

$$t_{\text{end}} := t + \Delta\tau_\varsigma / R_{I_c}, \quad \Delta t := \Delta\tau_\varsigma / (KR_{I_c})$$

**While**  $t < t_{\text{end}}$

**SendInterfaceData**( $\mathcal{I}(t)$ ,  $\vec{u}^S|_{\tau}(t)$ )

ReceiveInterfaceData( $p^F|_{\tau}$ )

**UpdateSolid( $p^F|_T$ ,  $\Delta t$ )**

$$t := t + \Delta t$$

$\Delta t := \min(\text{StableSolidTimeStep}(), t_{\text{end}} - t)$

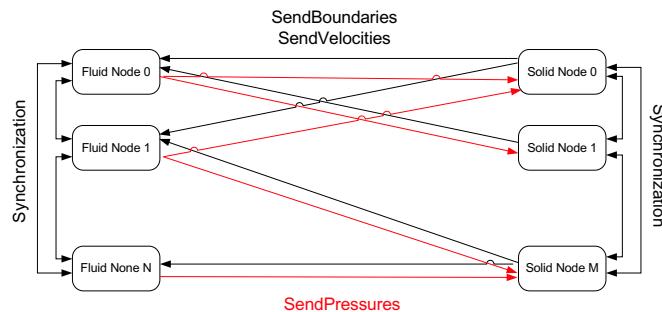

with  $R_I = \prod'_{\iota=0} r_\iota$

- Time step stays constant for  $R_{l_c}$  steps, which corresponds to one fluid step at level 0

# Parallelization strategy for coupled simulations

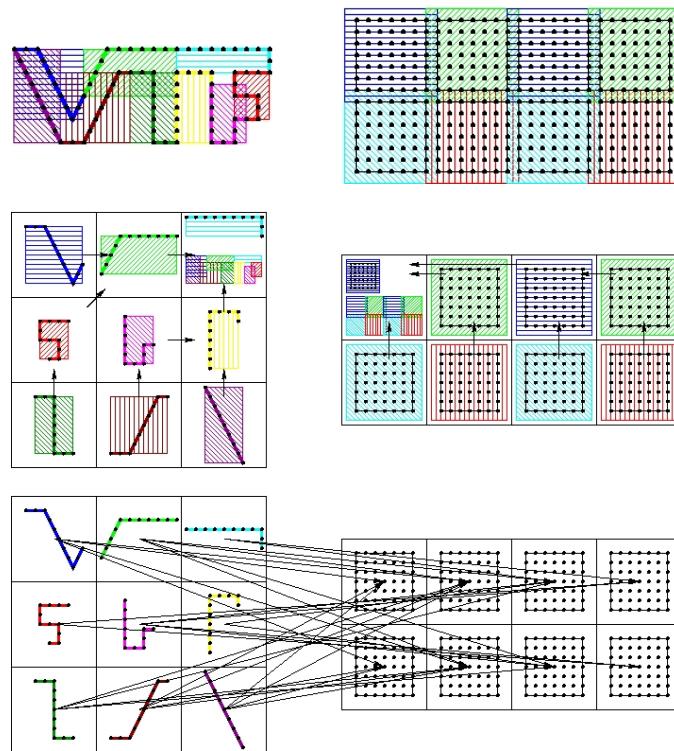

## Coupling of an Eulerian FV fluid Solver and a Lagrangian FEM Solver:

- ▶ Distribute both meshes separately and copy necessary nodal values and geometry data to fluid nodes
  - ▶ Setting of ghost cell values becomes strictly local operation
  - ▶ Construct new nodal values strictly local on fluid nodes and transfer them back to solid nodes
  - ▶ Only surface data is transferred
  - ▶ Asynchronous communication ensures scalability
  - ▶ Generic encapsulated implementation guarantees reusability

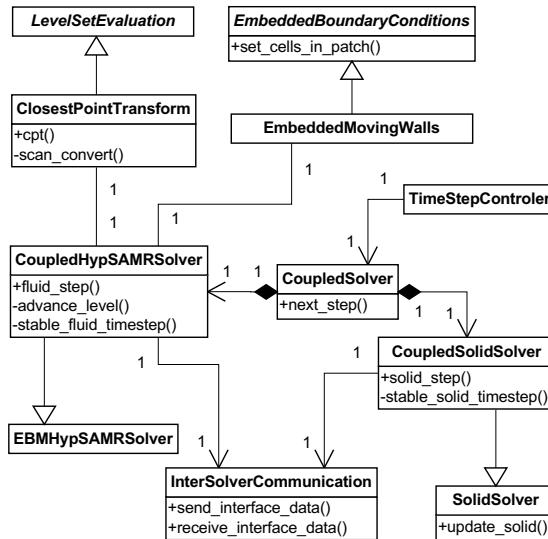

# Eulerian/Lagrangian communication module

1. Put bounding boxes around each solid processors piece of the boundary and around each fluid processors grid
2. Gather, exchange and broadcast of bounding box information
3. Optimal point-to-point communication pattern, non-blocking

# FSI coupling

- ▶ Coupling algorithm implemented in further derived HypSAMRSolver class
  - ▶ Level set evaluation always with CPT algorithm
  - ▶ Parallel communication through efficient non-blocking communication module ELC
  - ▶ Time step selection for both solvers through CoupledSolver class

- ▶ **AMRELCGFSolver**<**VectorType**, **FixupType**, **FlagType**, **dim**> is the derived AMRSolver<> class. [code/amroc/doc/html/amr/classAMRELCGFSolver.html](#)
  - ▶ Uses the Eulerian interface of the Lagrangian communication routines  
[code/stlib/doc/html/elc/elc\\_\\_page.html](#)
  - ▶ and the closest point transform algorithm [code/stlib/doc/html/cpt/cpt\\_\\_page.html](#) through the **CPTLevelSet**<**DataType**, **dim**>  
[code/amroc/doc/html/amr/classCPTLevelSet.html](#)

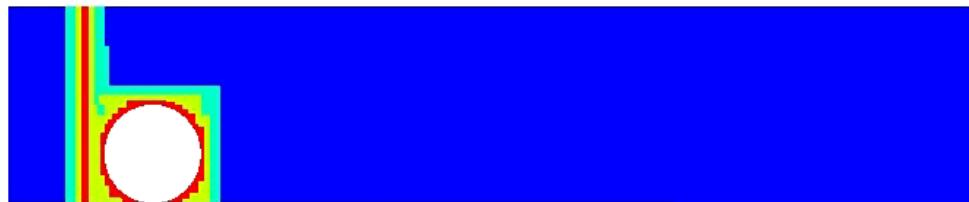

# Lift-up of a spherical body

Cylindrical body hit by Mach 3 shockwave, 2D test case by  
[Falcovitz et al., 1997]

Schlieren plot of density

Refinement levels

[code/amroc/doc/html/apps/clawpack\\_2applications\\_2euler\\_22d\\_2SphereLiftOff\\_2src\\_2Problem\\_8h\\_source.html](code/amroc/doc/html/apps/clawpack_2applications_2euler_22d_2SphereLiftOff_2src_2Problem_8h_source.html)

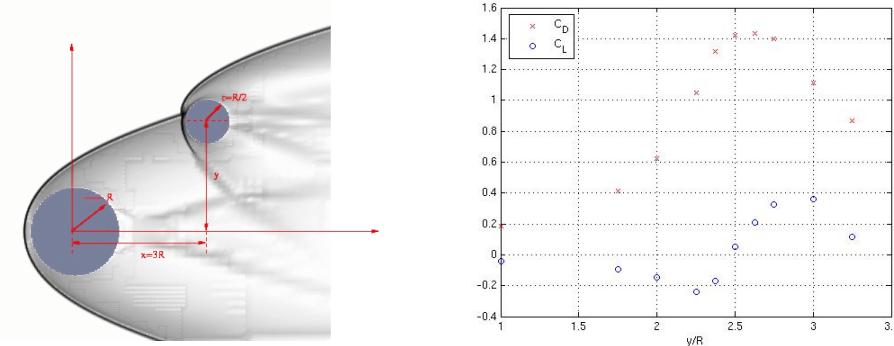

# Proximal bodies in hypersonic flow

Flow modeled by Euler equations for a single polytropic gas with  $p = (\gamma - 1) \rho e$

$$\partial_t \rho + \partial_{x_n}(\rho u_n) = 0, \quad \partial_t(\rho u_k) + \partial_{x_n}(\rho u_k u_n + \delta_{kn} p) = 0, \quad \partial_t(\rho E) + \partial_{x_n}(u_n(\rho E + p)) = 0$$

Numerical approximation with

- ▶ Finite volume flux-vector splitting scheme with MUSCL reconstruction, dimensional splitting
- ▶ Spherical bodies, force computation with overlaid latitude-longitude mesh to obtain drag and lift coefficients  $C_{D,L} = \frac{2F_{D,L}}{\rho v^2 \pi r^2}$
- ▶ inflow  $M = 10$ ,  $C_D$  and  $C_L$  on secondary sphere, lateral position varied, no motion

# Verification and validation

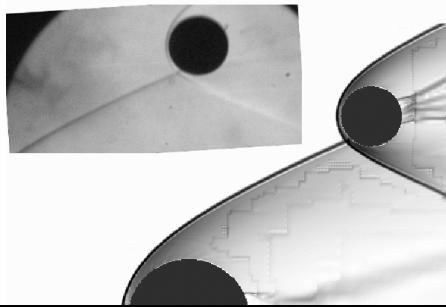

Static force measurements,  $M = 10$ :  
[Laurence et al., 2007]

- Refinement study:  $40 \times 40 \times 32$  base grid , up to without AMR up to  $\sim 209.7 \cdot 10^6$  cells, largest run  $\sim 35,000$  h CPU

$I_{\max}$	$C_D$	$\Delta C_D$	$C_L$	$\Delta C_L$
1	1.264		-0.176	
2	1.442	0.178	-0.019	0.157
3	1.423	-0.019	0.052	0.071
4	1.408	-0.015	0.087	0.035

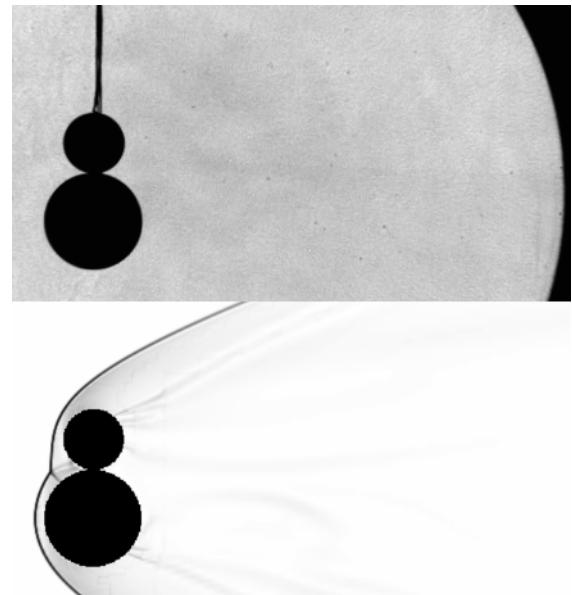

- Comparison with experimental results: 3 additional levels,  $\sim 2000$  h CPU

	Experimental	Computational
$C_D$	$1.11 \pm 0.08$	1.01
$C_L$	$0.29 \pm 0.05$	0.28

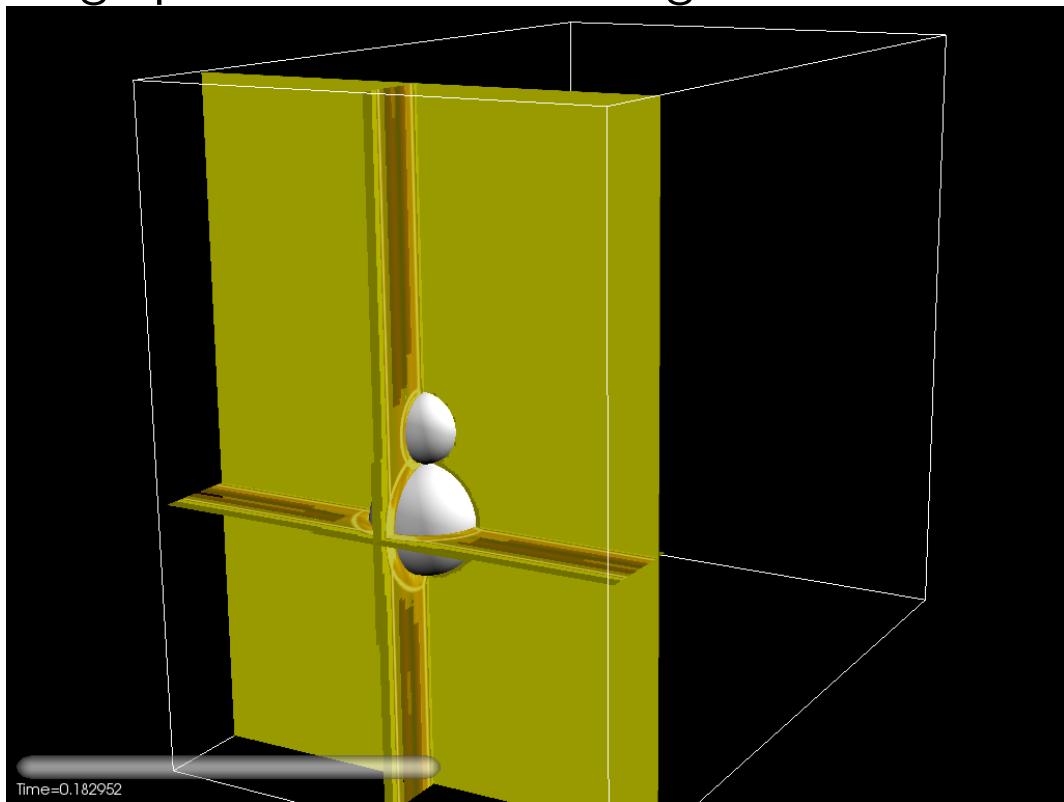

Dynamic motion,  $M = 4$ :

- Base grid  $150 \times 125 \times 90$ , two additional levels with  $r_{1,2} = 2$
- 24,704 time steps, 36,808 h CPU on 256 cores IBM BG/P

[Laurence and Deiterding, 2011]

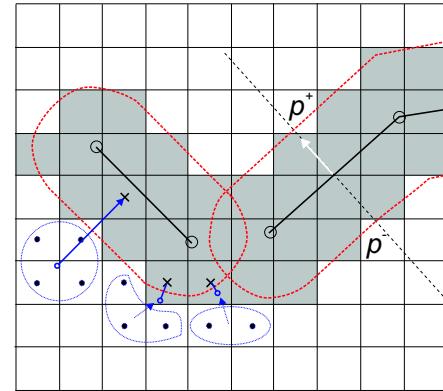

## Schlieren graphics on refinement regions

[code/amroc/doc/html/apps/clawpack\\_2applications\\_2euler\\_23d\\_2Spheres\\_2src\\_2Problem\\_8h\\_source.html](http://code/amroc/doc/html/apps/clawpack_2applications_2euler_23d_2Spheres_2src_2Problem_8h_source.html)

# Treatment of thin structures

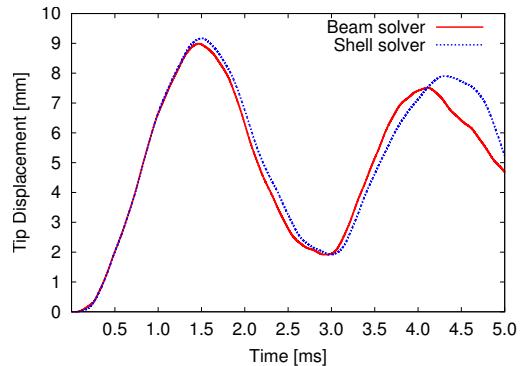

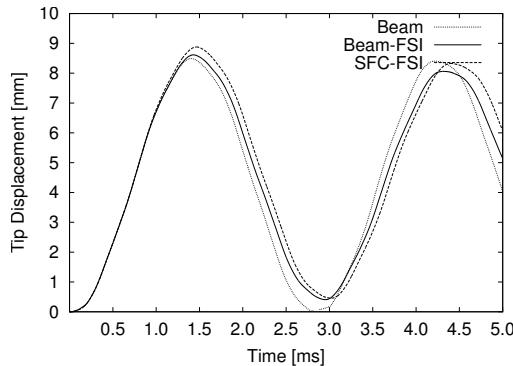

- ▶ Thin boundary structures or lower-dimensional shells require “thickening” to apply embedded boundary method
- ▶ Unsigned distance level set function  $\varphi$
- ▶ Treat cells with  $0 < \varphi < d$  as ghost fluid cells
- ▶ Leaving  $\varphi$  unmodified ensures correctness of  $\nabla\varphi$
- ▶ Use face normal in shell element to evaluate in  $\Delta p = p^+ - p^-$
- ▶ Utilize finite difference solver using the beam equation

to verify FSI algorithms

# FSI verification by elastic vibration

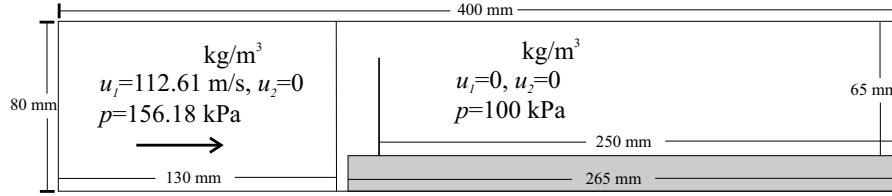

- ▶ Thin steel plate (thickness  $h = 1$  mm, length 50 mm), clamped at lower end
- ▶  $\rho_s = 7600 \text{ kg/m}^3$ ,  $E = 220 \text{ GPa}$ ,  $I = h^3/12$ ,  $\nu = 0.3$
- ▶ Modeled with beam solver (101 points) and thin-shell FEM solver (325 triangles) by F. Cirak
- ▶ Left: Coupling verification with constant instantaneous loading by  $\Delta p = 100 \text{ kPa}$
- ▶ Right: FSI verification with Mach 1.21 shockwave in air ( $\gamma = 1.4$ )

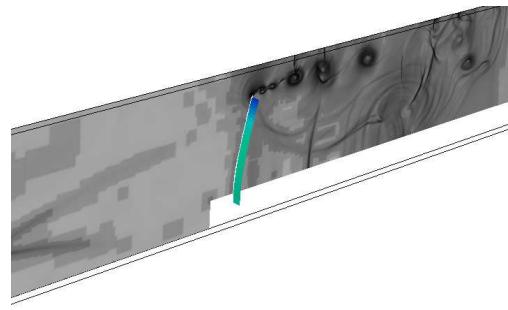

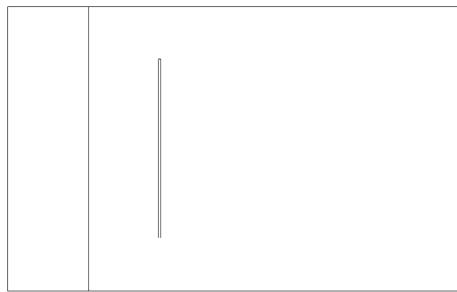

# Shock-driven elastic panel motion

Test case suggested by [Giordano et al., 2005]

- ▶ Forward facing step geometry, fixed walls everywhere except at inflow

- ▶ SAMR base mesh  $320 \times 64(\times 2)$ ,  $r_{1,2} = 2$
- ▶ Intel 3.4GHz Xeon dual processors, GB Ethernet interconnect
  - ▶ Beam-FSI: 12.25 h CPU on 3 fluid CPU + 1 solid CPU  
[code/doc/html/capps/beam-amroc\\_2VibratingBeam\\_2src\\_2FluidProblem\\_8h\\_source.html](code/doc/html/capps/beam-amroc_2VibratingBeam_2src_2FluidProblem_8h_source.html),  
[code/doc/html/capps/beam-amroc\\_2VibratingBeam\\_2src\\_2SolidProblem\\_8h\\_source.html](code/doc/html/capps/beam-amroc_2VibratingBeam_2src_2SolidProblem_8h_source.html)
  - ▶ FEM-FSI: 322 h CPU on 14 fluid CPU + 2 solid CPU  
[code/doc/html/capps/sfc-amroc\\_2VibratingPanel\\_2src\\_2FluidProblem\\_8h\\_source.html](code/doc/html/capps/sfc-amroc_2VibratingPanel_2src_2FluidProblem_8h_source.html),  
[code/doc/html/capps/VibratingPanel\\_2src\\_2ShellManagerSpecific\\_8h\\_source.html](code/doc/html/capps/VibratingPanel_2src_2ShellManagerSpecific_8h_source.html)

$t = 1.56$  ms after impact

# Detonation-driven plastic deformation

Chapman-Jouguet detonation in a tube filled with a stoichiometric ethylene and oxygen ( $C_2H_4 + 3 O_2$ , 295 K) mixture. Euler equations with single exothermic reaction  $A \rightarrow B$

$$\begin{aligned}\partial_t \rho + \partial_{x_n}(\rho u_n) &= 0, \quad \partial_t(\rho u_k) + \partial_{x_n}(\rho u_k u_n + \delta_{kn} p) = 0, k = 1, \dots, d \\ \partial_t(\rho E) + \partial_{x_n}(u_n(\rho E + p)) &= 0, \quad \partial_t(Y\rho) + \partial_{x_n}(Y\rho u_n) = \psi\end{aligned}$$

with

$$p = (\gamma - 1)(\rho E - \frac{1}{2}\rho u_n u_n - \rho Y q_0) \quad \text{and} \quad \psi = -k Y \rho \exp\left(\frac{-E_A \rho}{p}\right)$$

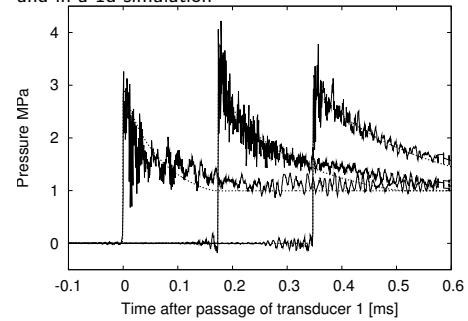

modeled with heuristic detonation model by  
 [Mader, 1979]

```

 $V := \rho^{-1}, V_0 := \rho_0^{-1}, V_{CJ} := \rho_{CJ}$ 
 $Y' := 1 - (V - V_0)/(V_{CJ} - V_0)$ 
If  $0 \leq Y' \leq 1$  and  $Y > 10^{-8}$  then
    If  $Y < Y'$  and  $Y' < 0.9$  then  $Y' := 0$ 
    If  $Y' < 0.99$  then  $p' := (1 - Y')p_{CJ}$ 
        else  $p' := p$ 
 $\rho_A := Y' \rho$ 
 $E := p' / (\rho(\gamma - 1)) + Y' q_0 + \frac{1}{2} u_n u_n$ 

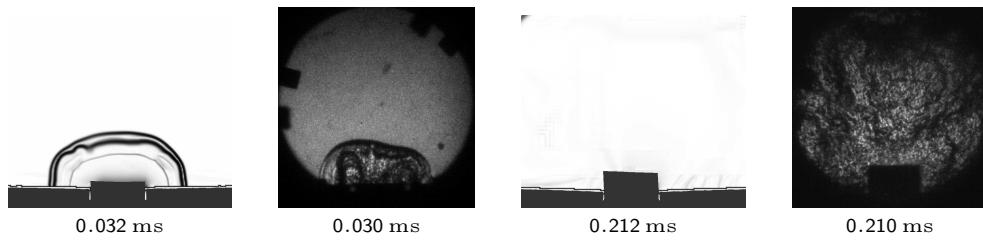

```

Comparison of the pressure traces in the experiment and in a 1d simulation

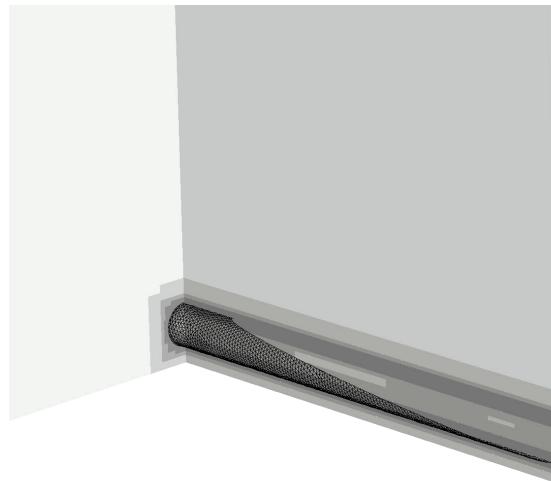

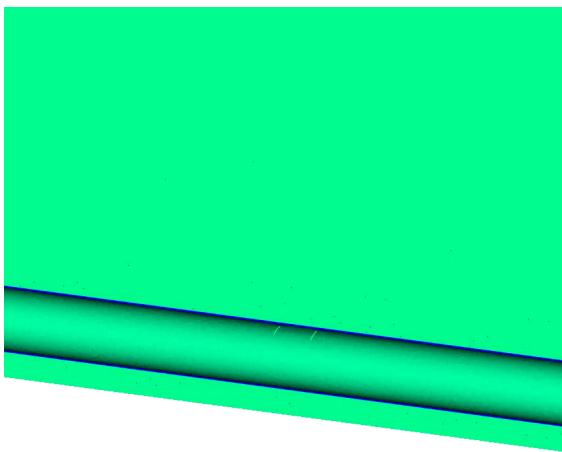

# Tube with flaps

- ▶ Fluid: VanLeer FVS
  - ▶ Detonation model with  $\gamma = 1.24$ ,  $p_{\text{CJ}} = 3.3 \text{ MPa}$ ,  $D_{\text{CJ}} = 2376 \text{ m/s}$
  - ▶ AMR base level:  $104 \times 80 \times 242$ ,  $r_{1,2} = 2$ ,  $r_3 = 4$
  - ▶  $\sim 4 \cdot 10^7$  cells instead of  $7.9 \cdot 10^9$  cells (uniform)
  - ▶ Tube and detonation fully refined
  - ▶ Thickening of 2D mesh: 0.81 mm on both sides (real 0.445 mm)
- ▶ Solid: thin-shell solver by F. Cirak
  - ▶ Aluminum, J2 plasticity with hardening, rate sensitivity, and thermal softening
  - ▶ Mesh: 8577 nodes, 17056 elements
- ▶ 16+2 nodes 2.2 GHz AMD Opteron quad processor, PCI-X 4x Infiniband network,  $\sim 4320 \text{ h}$  CPU to  $t_{\text{end}} = 450 \mu\text{s}$

## Tube with flaps: results

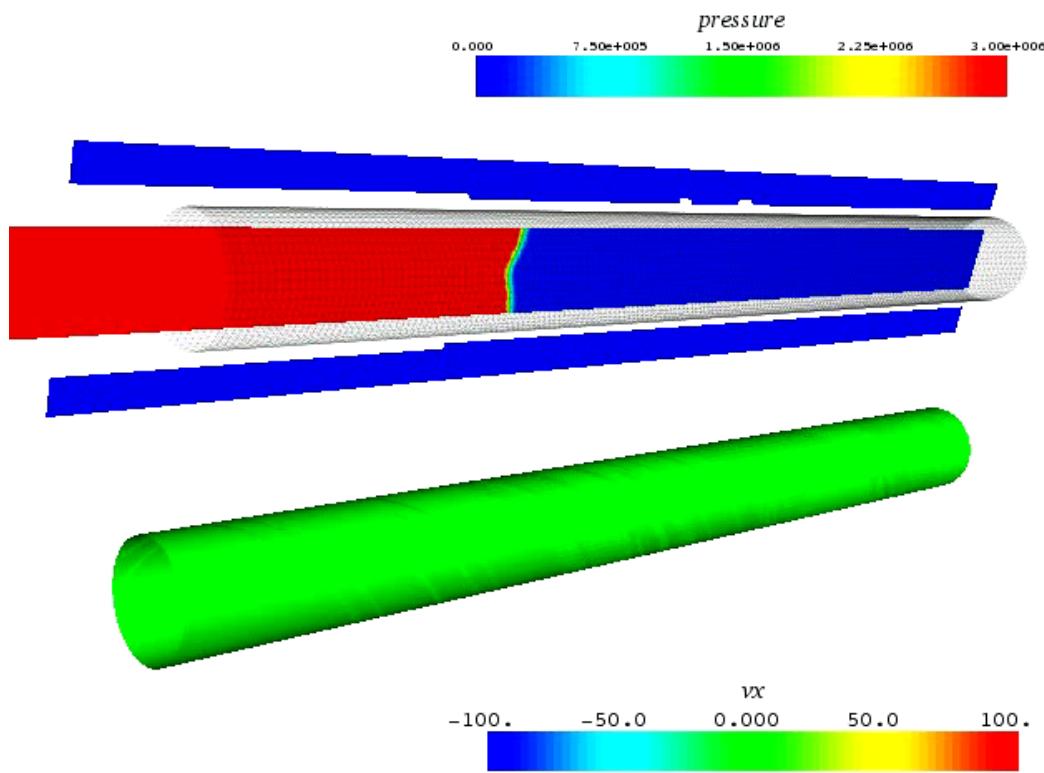

Fluid density and displacement in y-direction in solid

Schlieren plot of fluid density on refinement levels

# Underwater explosion modeling

Volume fraction based two-component model with  $\sum_{i=1}^m \alpha^i = 1$ , that defines mixture quantities as

$$\rho = \sum_{i=1}^m \alpha^i \rho^i, \quad \rho u_n = \sum_{i=1}^m \alpha^i \rho^i u_n^i, \quad \rho e = \sum_{i=1}^m \alpha^i \rho^i e^i$$

Assuming total pressure  $p = (\gamma - 1) \rho e - \gamma p_\infty$  and speed of sound  $c = (\gamma(p + p_\infty)/\rho)^{1/2}$  yields

$$\frac{p}{\gamma - 1} = \sum_{i=1}^m \frac{\alpha^i p^i}{\gamma^i - 1}, \quad \frac{\gamma p_\infty}{\gamma - 1} = \sum_{i=1}^m \frac{\alpha^i \gamma^i p_\infty^i}{\gamma^i - 1}$$

and the overall set of equations [Shyue, 1998]

$$\partial_t \rho + \partial_{x_n}(\rho u_n) = 0, \quad \partial_t(\rho u_k) + \partial_{x_n}(\rho u_k u_n + \delta_{kn} p) = 0, \quad \partial_t(\rho E) + \partial_{x_n}(u_n(\rho E + p)) = 0$$

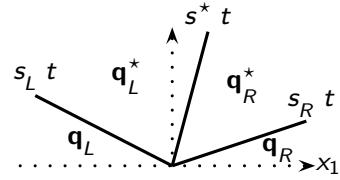

$$\frac{\partial}{\partial t} \left( \frac{1}{\gamma - 1} \right) + u_n \frac{\partial}{\partial x_n} \left( \frac{1}{\gamma - 1} \right) = 0, \quad \frac{\partial}{\partial t} \left( \frac{\gamma p_\infty}{\gamma - 1} \right) + u_n \frac{\partial}{\partial x_n} \left( \frac{\gamma p_\infty}{\gamma - 1} \right) = 0$$

Oscillation free at contacts: [Abgrall and Karni, 2001][Shyue, 2006]

## Approximate Riemann solver

Use HLLC approach because of robustness and positivity preservation

$$\mathbf{q}^{HLLC}(x_1, t) = \begin{cases} \mathbf{q}_L, & x_1 < s_L t, \\ \mathbf{q}_L^*, & s_L t \leq x_1 < s^* t, \\ \mathbf{q}_R^*, & s^* t \leq x_1 \leq s_R t, \\ \mathbf{q}_R, & x_1 > s_R t, \end{cases}$$

Wave speed estimates [Davis, 1988]  $s_L = \min\{u_{1,L} - c_L, u_{1,R} - c_R\}$ ,

$$s_R = \max\{u_{1,L} + c_L, u_{1,R} + c_R\}$$

Unknown state [Toro et al., 1994]

$$s^* = \frac{p_R - p_L + s_L u_{1,L} (s_L - u_{1,L}) - \rho_R u_{1,R} (s_R - u_{1,R})}{\rho_L (s_L - u_{1,L}) - \rho_R (s_R - u_{1,R})}$$

$$\mathbf{q}_\tau^\star = \left[ \eta, \eta s^\star, \eta u_2, \eta \left[ \frac{(\rho E)_\tau}{\rho_\tau} + (s^\star - u_{1,\tau}) \left( s_\tau + \frac{p_\tau}{\rho_\tau(s_\tau - u_{1,\tau})} \right) \right], \frac{1}{\gamma_\tau - 1}, \frac{\gamma_\tau p_{\infty,\tau}}{\gamma_\tau - 1} \right]^T$$

$$\eta = \rho_\tau \frac{s_\tau - u_{1,\tau}}{s_\tau - s^\star}, \quad \tau = \{L, R\}$$

Evaluate waves as  $\mathcal{W}_1 = \mathbf{q}_L^* - \mathbf{q}_L$ ,  $\mathcal{W}_2 = \mathbf{q}_P^* - \mathbf{q}_L^*$ ,  $\mathcal{W}_3 = \mathbf{q}_R - \mathbf{q}_P^*$  and  $\lambda_1 = s_L$ ,

$\lambda_2 = s^*$ ,  $\lambda_3 = s_R$  to compute the fluctuations  $\mathcal{A}^{-\Delta} \sum_{\lambda < 0} \lambda_\nu \mathcal{W}_\nu$ ,

$$\mathcal{A}^+ \Delta = \sum_{\lambda_\nu > 0} \lambda_\nu \mathcal{W}_\nu \text{ for } \nu = \{1, 2, 3\}$$

Overall scheme: Wave Propagation method [Shyue, 2006]

# Underwater explosion FSI simulations

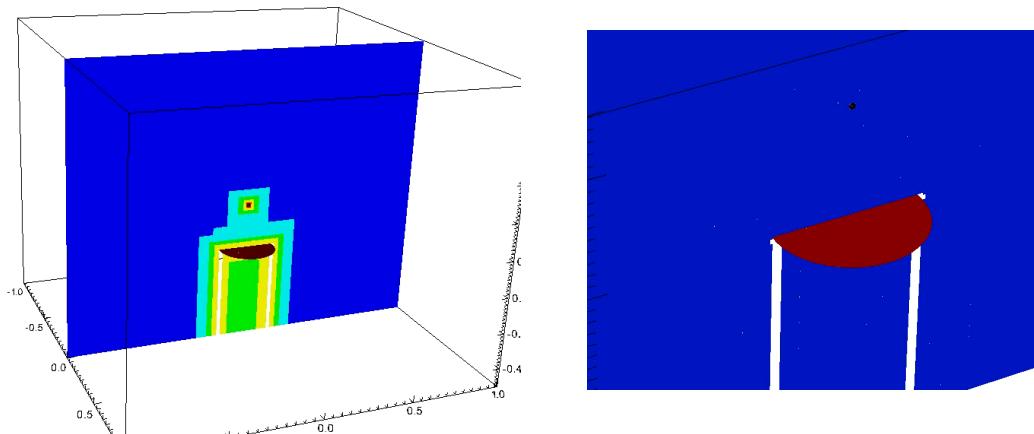

- ▶ Air:  $\gamma^A = 1.4$ ,  $p_\infty^A = 0$ ,  $\rho^A = 1.29 \text{ kg/m}^3$
  - ▶ Water:  $\gamma^W = 7.415$ ,  $p_\infty^W = 296.2 \text{ MPa}$ ,  $\rho^W = 1027 \text{ kg/m}^3$

## Blast explosion in a multistory building – II

# Outline

## Fluid-structure interaction

- Coupling to a solid mechanics solver
- Implementation
- Rigid body motion
- Thin elastic and deforming thin structures
- Deformation from water hammer
- Real-world example

## Massively parallel SAMR

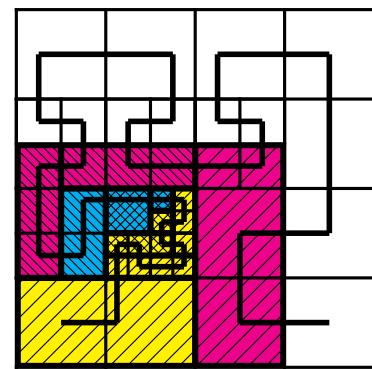

- Performance data from AMROC

# Parallelized construction of space-filling curve

## Computation of space filling curve

### ► Partition-Init

1. Compute aggregated workload for new grid hierarchy and project result onto level 0
2. Construct recursively SFC-units until work in each unit is homogeneous, GuCFactor defines minimal coarseness relative to level-0 grid

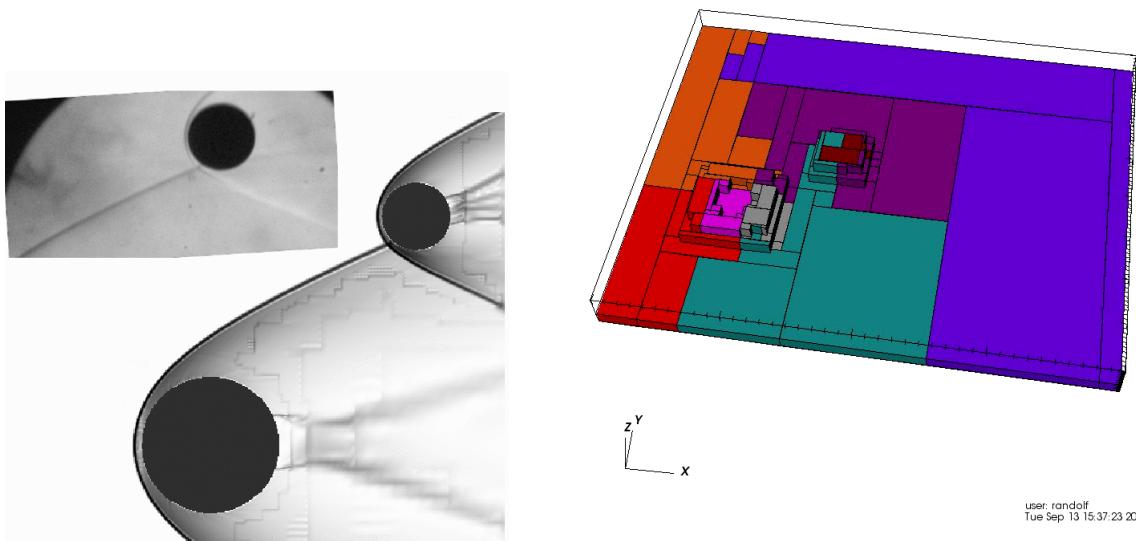

### ► Partition-Calc

1. Compute entire workload and new work for each processor
  2. Go sequentially through SFC-ordered list of partitioning units and assign units to processors, refine partition if necessary and possible
- Ensure scalability of Partition-Init by creating SFC-units strictly local
- Currently still use of MPI\_allgather() to create globally identical input for Partition-Calc (can be a bottleneck for weak scalability)

## Partitioning example

DB: trace8\_0.vtk

- ▶ Cylinders of spheres in supersonic flow
- ▶ Predict force on secondary body
- ▶ Right: 200x160 base mesh, 3 Levels, factors 2,2,2, 8 CPUs

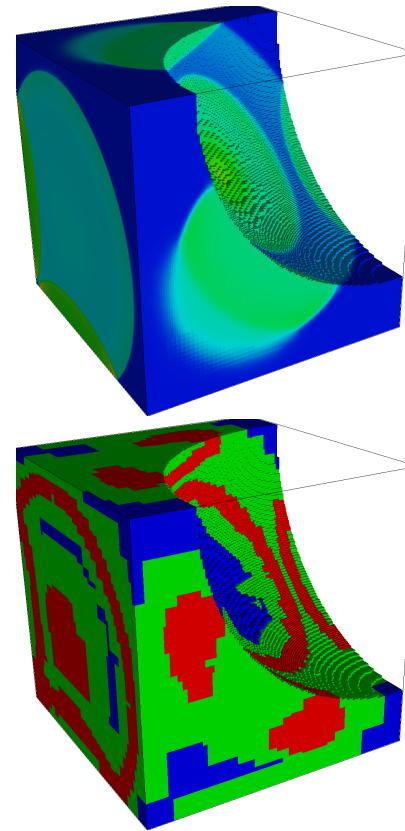

[Laurence et al., 2007]

## First performance assessment

- ▶ Test run on 2.2 GHz AMD Opteron quad-core cluster connected with Infiniband
- ▶ Cartesian test configuration
- ▶ Spherical blast wave, Euler equations, 3rd order WENO scheme, 3-step Runge-Kutta update
- ▶ AMR base grid  $64^3$ ,  $r_{1,2} = 2$ , 89 time steps on coarsest level
- ▶ With embedded boundary method: 96 time steps on coarsest level
- ▶ Redistribute in parallel every 2nd base level step
- ▶ Uniform grid  $256^3 = 16.8 \cdot 10^6$  cells

Level	Grids	Cells
0	115	262,144
1	373	1,589,808
2	2282	5,907,064

Grid and cells used on 16 CPUs

## Cost of SAMR and ghost-fluid method

- ▶ Flux correction is negligible
  - ▶ Clustering is negligible (already local approach). For the complexities of a scalable global clustering algorithm see [Gunney et al., 2007]
  - ▶ Costs for GFM constant around  $\sim 36\%$
  - ▶ Main costs: `Regrid(1)` operation and ghost cell synchronization

# AMROC scalability tests

## Basic test configuration

- ▶ Spherical blast wave, Euler equations, 3D wave propagation method
  - ▶ AMR base grid  $32^3$  with  $r_{1,2} = 2, 4, 5$  time steps on coarsest level
  - ▶ Uniform grid  $256^3 = 16.8 \cdot 10^6$  cells, 19 time steps
  - ▶ Flux correction deactivated
  - ▶ No volume I/O operations
  - ▶ Tests run IBM BG/P (mode VN)

## Weak scalability test

- ▶ Reproduction of configuration each 64 CPUs
  - ▶ On 1024 CPUs:  $128 \times 64 \times 64$  base grid,  $> 33,500$  Grids,  $\sim 61 \cdot 10^6$  cells, uniform  $1024 \times 512 \times 512 = 268 \cdot 10^6$  cells

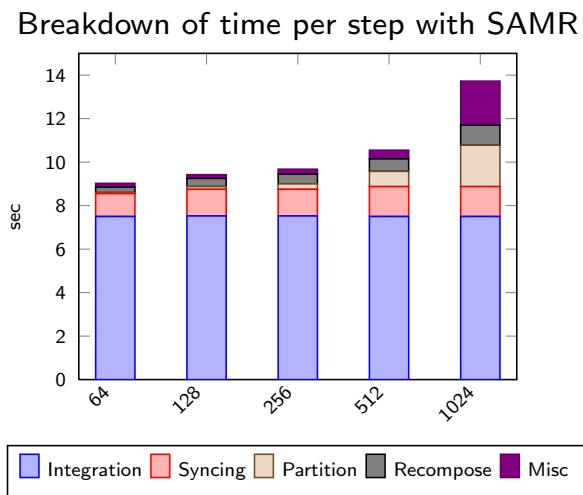

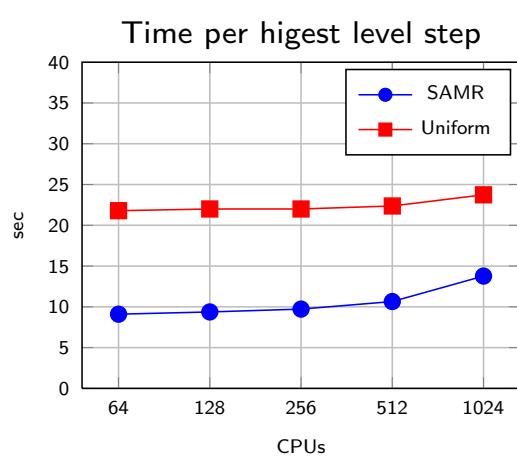

Level	Grids	Cells
0	606	32,768
1	575	135,312
2	910	3,639,040

## Strong scalability test

- ▶  $64 \times 32 \times 32$  base grid, uniform  
 $512 \times 256 \times 256 = 33.6 \cdot 10^6$  cells

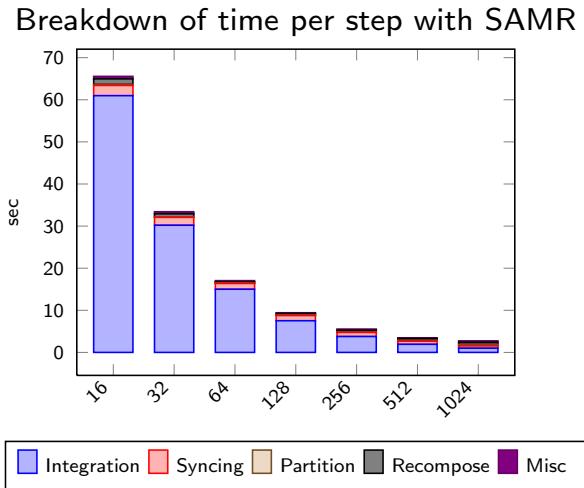

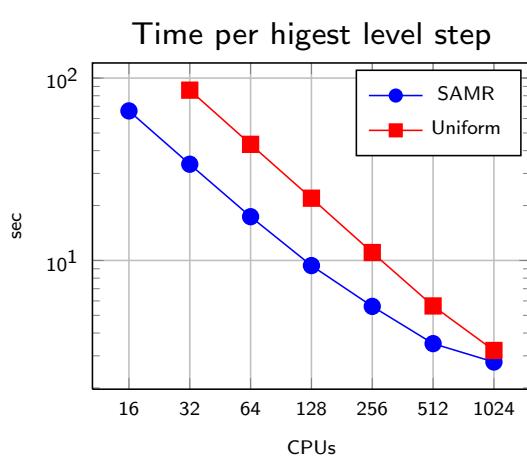

Level	Grids	Cells
0	1709	65,536
1	1735	271,048
2	2210	7,190,208

## Weak scalability test

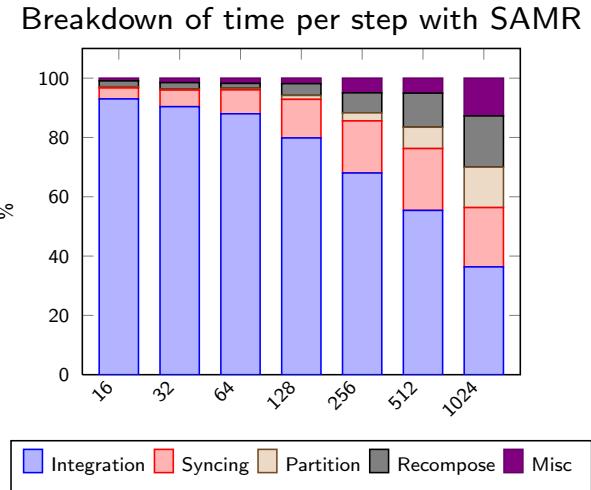

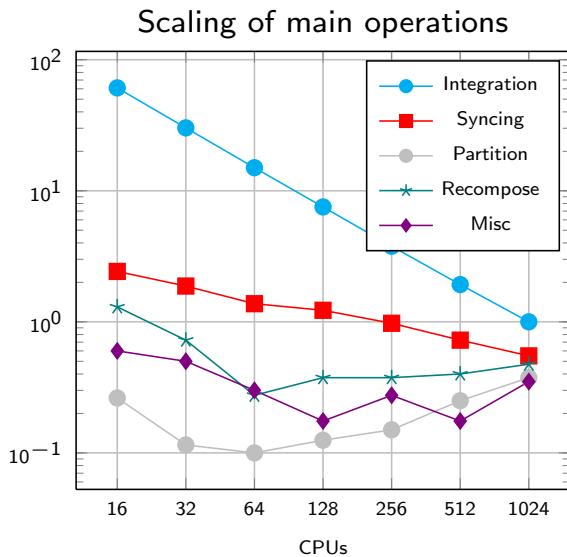

- ▶ Costs for Syncing basically constant
- ▶ Partitioning, Recompose, Misc (origin not clear) increase
- ▶ 1024 required usage of -DUAL option due to usage of global lists data structures in Partition-Calc and Recompose

## Strong scalability test

- ▶ Uniform code has basically linear scalability (explicit method)
- ▶ SAMR visibly loses efficiency for > 512 CPU, or 15,000 finite volume cells per CPU

## Strong scalability test - II

- ▶ Perfect scaling of Integration, reasonable scaling of Syncing
- ▶ Strong scalability of Partition needs to be addressed (eliminate global lists)

# Approximation of Boltzmann equation

Is based on solving the Boltzmann equation with a simplified collision operator

$$\partial_t f + \mathbf{u} \cdot \nabla f = \omega(f^{eq} - f)$$

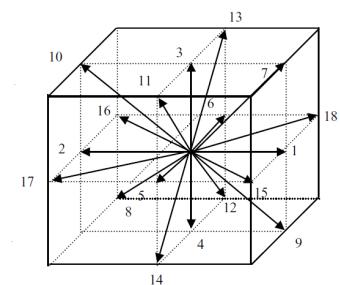

- ▶  $\text{Kn} = I_f/L \ll 1$ , where  $I_f$  is replaced with  $\Delta x$
  - ▶ Weak compressibility and small Mach number assumed
  - ▶ Assume a simplified phase space

Equation is approximated with a splitting approach.

1.) Transport step solves  $\partial_t f_\alpha + \mathbf{e}_\alpha \cdot \nabla f_\alpha = 0$

Operator:  $\mathcal{T}: \tilde{f}_\alpha(\mathbf{x} + \mathbf{e}_\alpha \Delta t, t + \Delta t) = f_\alpha(\mathbf{x}, t)$

$$\rho(\mathbf{x}, t) = \sum_{\alpha=0}^{18} f_\alpha(\mathbf{x}, t), \quad \rho(\mathbf{x}, t) u_i(\mathbf{x}, t) = \sum_{\alpha=0}^{18} \mathbf{e}_{\alpha i} f_\alpha(\mathbf{x}, t)$$

Discrete velocities:

$$\mathbf{e}_\alpha = \begin{cases} 0, & \alpha = 0, \\ (\pm 1, 0, 0)c, (0, \pm 1, 0)c, (0, 0, \pm 1)c, & \alpha = 1, \dots, 6, \\ (\pm 1, \pm 1, 0)c, (\pm 1, 0, \pm 1)c, (0, \pm 1, \pm 1)c, & \alpha = 7, \dots, 18, \end{cases}$$

# Approximation of thermal equilibrium

2.) Collision step solves  $\partial_t f_\alpha = \omega(f_\alpha^{eq} - f_\alpha)$

Operator  $\mathcal{C}$ :

$$f_\alpha(\cdot, t + \Delta t) = \tilde{f}_\alpha(\cdot, t + \Delta t) + \omega_L \Delta t \left( \tilde{f}_\alpha^{eq}(\cdot, t + \Delta t) - \tilde{f}_\alpha(\cdot, t + \Delta t) \right)$$

with equilibrium function

$$f_\alpha^{eq}(\rho, \mathbf{u}) = \rho t_\alpha \left[ 1 + \frac{3\mathbf{e}_\alpha \mathbf{u}}{c^2} + \frac{9(\mathbf{e}_\alpha \mathbf{u})^2}{2c^4} - \frac{3\mathbf{u}^2}{2c^2} \right]$$

$$\text{Pressure } \delta p = \sum_{\alpha} f_{\alpha}^{eq} c_s^2 = \rho c_s^2.$$

$$\text{Dev. stress } \Sigma_{ij} = \left(1 - \frac{\omega_L \Delta t}{2}\right) \sum_{\alpha} \mathbf{e}_{\alpha i} \mathbf{e}_{\alpha j} (f_{\alpha}^{eq} - f_{\alpha})$$

Is derived by assuming a Maxwell-Boltzmann distribution of  $f_\alpha^{eq}$  and approximating the involved  $\exp()$  function with a Taylor series to second-order accuracy.

### Using the third-order equilibrium function

$$f_\alpha^{eq}(\rho, \mathbf{u}) = \rho t_\alpha \left[ 1 + \frac{3\mathbf{e}_\alpha \mathbf{u}}{c^2} + \frac{9(\mathbf{e}_\alpha \mathbf{u})^2}{2c^4} - \frac{3\mathbf{u}^2}{2c^2} + \frac{\mathbf{e}_\alpha \mathbf{u}}{3c^2} \left( \frac{9(\mathbf{e}_\alpha \mathbf{u})^2}{2c^4} - \frac{3\mathbf{u}^2}{2c^2} \right) \right]$$

allows higher flow velocities.

# Relation to Navier-Stokes equations

Inserting a Chapman-Enskog expansion, that is,

$$f_\alpha = f_\alpha(0) + \epsilon f_\alpha(1) + \epsilon^2 f_\alpha(2) + \dots$$

and using

$$\frac{\partial}{\partial t} = \epsilon \frac{\partial}{\partial t_1} + \epsilon^2 \frac{\partial}{\partial t_2} + \dots, \quad \nabla = \epsilon \nabla_1 + \epsilon^2 \nabla_2 + \dots$$

into the LBM and summing over  $\alpha$  one can show that the continuity and moment equations are recovered to  $O(\epsilon^2)$  [Hou et al., 1996]

$$\partial_t \rho + \nabla \cdot (\rho \mathbf{u}) = 0$$

$$\partial_t \mathbf{u} + \mathbf{u} \cdot \nabla \mathbf{u} = -\nabla p + \nu \nabla^2 \mathbf{u}$$

Kinematic viscosity and collision time are connected by

$$\nu = \frac{1}{3} \left( \frac{\tau_L}{\Delta t} - \frac{1}{2} \right) c \Delta x$$

from which one gets with  $\sqrt{3}c_s = \frac{\Delta x}{\Delta t}$  [Hähnel, 2004]

$$\omega_L = \tau_L^{-1} = \frac{c_s^2}{\nu + \Delta t c_s^2 / 2}$$

# Turbulence modeling

Pursue a large-eddy simulation approach with  $\bar{f}_\alpha$  and  $\bar{f}_\alpha^{eq}$ , i.e.

$$1.) \quad \tilde{\bar{f}}_{\alpha}(\mathbf{x} + \mathbf{e}_{\alpha}\Delta t, t + \Delta t) = \bar{f}_{\alpha}(\mathbf{x}, t)$$

$$2.) \bar{f}_\alpha(\cdot, t + \Delta t) = \tilde{\bar{f}}_\alpha(\cdot, t + \Delta t) + \frac{1}{\tau_*} \Delta t \left( \tilde{\bar{f}}_\alpha^{eq}(\cdot, t + \Delta t) - \tilde{\bar{f}}_\alpha(\cdot, t + \Delta t) \right)$$

$$\text{Effective viscosity: } \nu^* = \nu + \nu_t = \frac{1}{3} \left( \frac{\tau_L^*}{\Delta t} - \frac{1}{2} \right) c \Delta x \quad \text{with} \quad \tau_L^* = \tau_L + \tau_t$$

Use Smagorinsky model to evaluate  $\nu_t$ , e.g.,  $\nu_t = (C_{sm}\Delta x)^2 \bar{S}$ , where

$$\bar{S} = \sqrt{2 \sum_{i,j} \bar{\mathbf{S}}_{ij} \bar{\mathbf{S}}_{ij}}$$

The filtered strain rate tensor  $\bar{\mathbf{S}}_{ij} = (\partial_j \bar{u}_i + \partial_i \bar{u}_j)/2$  can be computed as a second moment as

$$\bar{\mathbf{S}}_{ij} = \frac{\Sigma_{ij}}{2\rho c_s^2 \tau_L^\star \left(1 - \frac{\omega_L \Delta t}{2}\right)} = \frac{1}{2\rho c_s^2 \tau_L^\star} \sum_\alpha \mathbf{e}_{\alpha i} \mathbf{e}_{\alpha j} (\bar{f}_\alpha^{eq} - \bar{f}_\alpha)$$

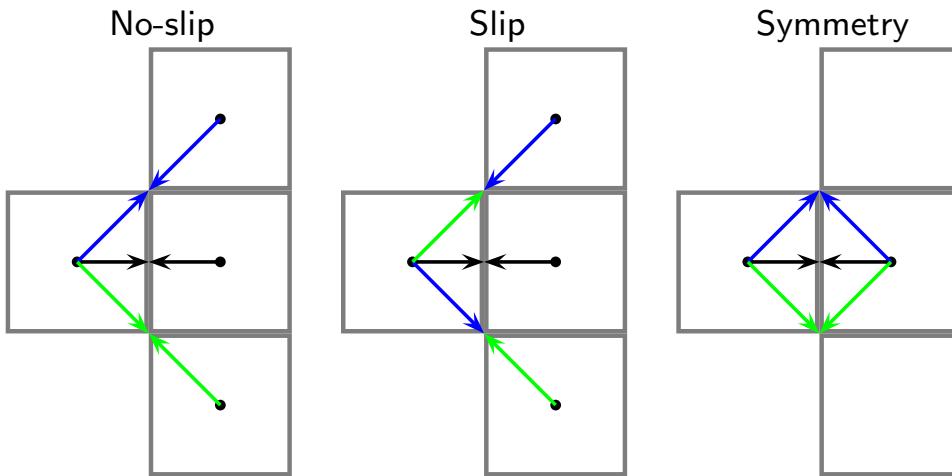

$\tau_t$  can be obtained as [Yu, 2004, Hou et al., 1996]

$$\tau_t = \frac{1}{2} \left( \sqrt{\tau_L^2 + 18\sqrt{2}(\rho_0 c^2)^{-1} C_{sm}^2 \Delta x \bar{S}} - \tau_L \right)$$

## Initial and boundary conditions

- Initial conditions are constructed as  $f_\alpha^{eq}(\rho(t=0), \mathbf{u}(t=0))$

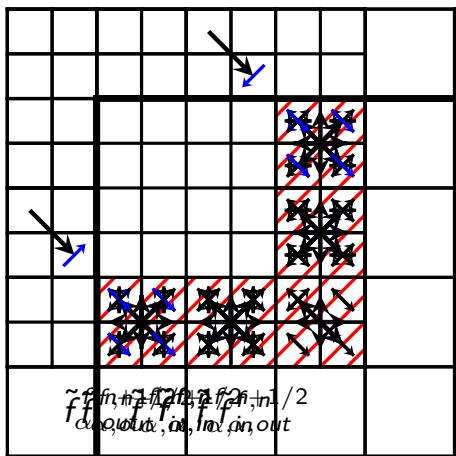

Simple boundary conditions:

- ▶ Outlet basically copies all distributions (zero gradient)
  - ▶ Inlet and pressure boundary conditions use  $f_\alpha^{eq}$
  - ▶ Embedded boundary conditions use ghost cell construction as before, then use  $f_\alpha^{eq}(\rho', \mathbf{u}')$  to construct distributions in embedded ghost cells

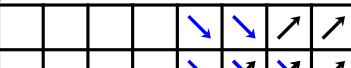

# Adaptive LBM

1. Complete update on coarse grid:  $f_\alpha^{C,n+1} := \mathcal{CT}(f_\alpha^{C,n})$
  2. Interpolate  $f_{\alpha,in}^{C,n}$  onto  $f_{\alpha,in}^{f,n}$  to fill fine halos. Set physical boundary conditions.
  3.  $\tilde{f}_\alpha^{f,n} := \mathcal{T}(f_\alpha^{f,n})$  on whole fine mesh.  $f_\alpha^{f,n+1/2} := \mathcal{C}(\tilde{f}_\alpha^{f,n})$  in interior.
  4.  $\tilde{f}_\alpha^{f,n+1/2} := \mathcal{T}(f_\alpha^{f,n+1/2})$  on whole fine mesh.  $f_\alpha^{f,n+1} := \mathcal{C}(\tilde{f}_\alpha^{f,n+1/2})$  in interior.

5. Average  $\tilde{f}_{\alpha,out}^{f,n+1/2}$  (inner halo layer),  $\tilde{f}_{\alpha,out}^{f,n}$  (outer halo layer) to obtain  $\tilde{f}_{\alpha,out}^{C,n}$ .
  6. Revert transport into halos:  
 $\bar{f}_{\alpha,out}^{C,n} := \mathcal{T}^{-1}(\tilde{f}_{\alpha,out}^{C,n})$
  7. Parallel synchronization of  $f_{\alpha}^{C,n}, \bar{f}_{\alpha,out}^{C,n}$
  8. Cell-wise update where correction is needed:  
 $f_{\alpha}^{C,n+1} := \mathcal{CT}(f_{\alpha}^{C,n}, \bar{f}_{\alpha,out}^{C,n})$

Algorithm equivalent to [Chen et al., 2006].

# Classes

Directory `amroc/lbm` contains the lattice Boltzmann integrator that is in C++ throughout and also is built on the classes in `amroc/amr/Interfaces`.

- ▶ Several SchemeType-classes are already provided: **LBMD1Q3<DataType>**, **LBMD2Q9<DataType>**, **LBMD3Q19<DataType>**, **LBMD2Q9Thermal<DataType>**, **LBMD3Q19Thermal<DataType>** included a large number of boundary conditions.

`code/amroc/doc/html/lbm/classLBMD1Q3.html` `code/amroc/doc/html/lbm/classLBMD2Q9.html`

`code/amroc/doc/html/lbm/classLBMD3Q19Thermal.html`

- ▶ Using function within LBMD?D?, the special coarse-fine correction is implemented in **LBMFixup<LBMTYPE, FixupType, dim>**

`code/amroc/doc/html/lbm/classLBMFixup.html`

- ▶ **LBMIntegrator<LBMTYPE, dim>**, **LBMGFMBoundary<LBMTYPE, dim>**, etc. interface to the generic classes in `amroc/amr/Interfaces`

`code/amroc/doc/html/amr/classSchemeGFBoundary.html`

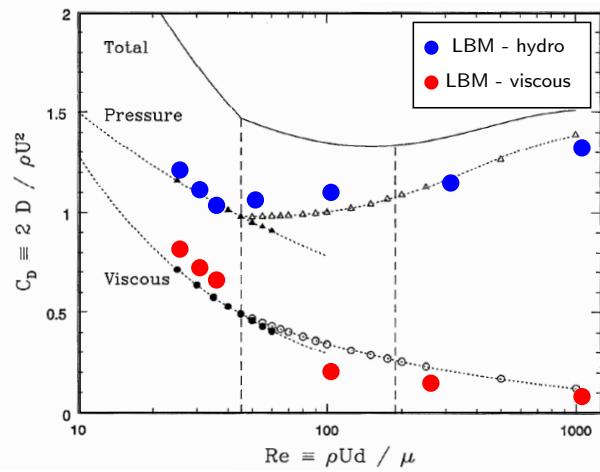

- ▶ **Problem.h**: Specific simulation is defined in `Problem.h` only. Predefined classes specified in **LBMStdProblem.h**, **LBMStdGFMPProblem.h** and **LBMProblem.h**.

`code/amroc/doc/html/lbm/LBMPProblem_8h_source.html` `code/amroc/doc/html/lbm/LBMStdProblem_8h.html`

`code/amroc/doc/html/lbm/LBMStdGFMPProblem_8h.html`

## Flow over 2D cylinder, $d = 2\text{ cm}$

- ▶ Air with
  $\nu = 1.61 \cdot 10^{-5} \text{ m}^2/\text{s}$ ,  
 $\rho = 1.205 \text{ kg/m}^3$
  - ▶ Domain size  
 $[-8d, 24d] \times [-8d, 8d]$
  - ▶ Dynamic refinement based on velocity. Last level to refine structure further.
  - ▶ Inflow from left.  
 Characteristic boundary conditions [Schlaffer, 2013]  
 elsewhere.

- ▶ Base lattice  $320 \times 160$ , 3 additional levels with factors  $r_l = 2, 4, 4$ .
  - ▶ Resolution:  $\sim 320$  points in diameter  $d$
  - ▶ Computation of  $C_D$  on 400 equidistant points along circle and averaged over time. Comparison above with [Henderson, 1995].

# Flow over cylinder in 2d - Re = 300, $u = 0.2415 \text{ m/s}$

## Isolines on refinement and distribution to processors

## Mesh adaptation with LBM:

1. Level-wise evaluation of  $\omega_L^I = \frac{c_s^2}{\nu + \Delta t_I c_s^2 / 2}$
  2. Exchange of distributions streaming across refinement interfaces

[code/amroc/doc/html/apps/lbm\\_2applications\\_2Navier-Stokes\\_22d\\_2CylinderDrag\\_2src\\_2Problem\\_8h\\_source.html](http://code/amroc/doc/html/apps/lbm_2applications_2Navier-Stokes_22d_2CylinderDrag_2src_2Problem_8h_source.html)

## Strong scalability test (1:25 train)

- ▶ Computation is restarted from disk checkpoint at  $t = 0.526408$  s from 96 core run.
- ▶ Time for initial re-partitioning removed from benchmark.
- ▶ 200 coarse level time steps computed.
- ▶ Regridding and re-partitioning every 2nd level-0 step.
- ▶ Computation starts with 51.8M cells (l3: 10.2M, l2: 15.3M, l1: 21.5M, l0= 4.8M) vs. 19.66 billion (uniform).
- ▶ Portions for parallel communication quite considerable (4 ghost cells still used).

Rigid body dynamics

## Motion solver

Based on the Newton-Euler method solution of dynamics equation of kinetic chains  
[Tsai, 1999]

$$\begin{pmatrix} \mathbf{F} \\ \boldsymbol{\tau}_P \end{pmatrix} = \begin{pmatrix} m\mathbf{1} & -m[\mathbf{c}]^\times \\ m[\mathbf{c}]^\times \mathbf{I}_{cm} & -m[\mathbf{c}]^\times [\mathbf{c}]^\times \end{pmatrix} \begin{pmatrix} \mathbf{a}_P \\ \boldsymbol{\alpha} \end{pmatrix} + \begin{pmatrix} m[\boldsymbol{\omega}]^\times [\boldsymbol{\omega}]^\times \mathbf{c} \\ [\boldsymbol{\omega}]^\times (\mathbf{I}_{cm} - m[\mathbf{c}]^\times [\mathbf{c}]^\times) \boldsymbol{\omega} \end{pmatrix}.$$

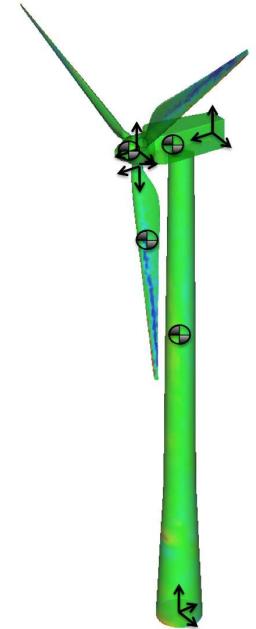

$m$  = mass of the body,  $\mathbf{1}$  = the  $4 \times 4$  homogeneous identity matrix,  
 $\mathbf{a}_P$  = acceleration of link frame with origin at  $P$  in the preceding link's frame,  
 $\mathbf{I}_{cm}$  = moment of inertia about the center of mass,  
 $\boldsymbol{\omega}$  = angular velocity of the body,  
 $\boldsymbol{\alpha}$  = angular acceleration of the body,  
 $\mathbf{c}$  is the location of the body's center of mass,  
and  $[\mathbf{c}]^\times$ ,  $[\boldsymbol{\omega}]^\times$  denote skew-symmetric cross product matrices.

Here, we additionally define the total force and torque acting on a body,

$$\mathbf{F} = (\mathbf{F}_{FSI} + \mathbf{F}_{prescribed}) \cdot \mathcal{C}_{xyz} \text{ and}$$

$$\boldsymbol{\tau} = (\boldsymbol{\tau}_{FSI} + \boldsymbol{\tau}_{prescribed}) \cdot \mathcal{C}_{\alpha\beta\gamma} \text{ respectively.}$$

Where  $\mathcal{C}_{xyz}$  and  $\mathcal{C}_{\alpha\beta\gamma}$  are the translational and rotational constraints, respectively.

## Two-segment hinged wing

Configuration by [Toomey and Eldredge, 2008].

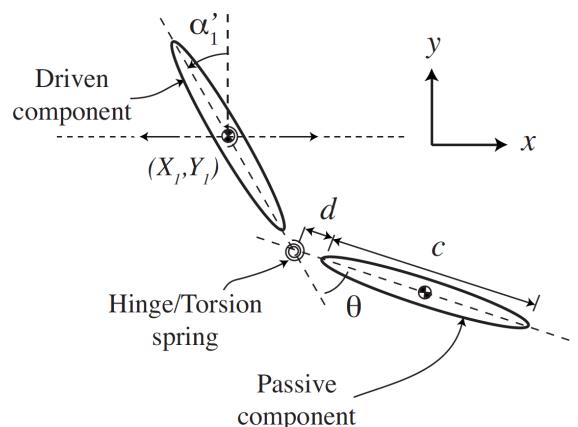

Manufactured bodies in tank filled with water.

## Prescribed translation and rotation

$$X_t(t) = \frac{A_0}{2} \frac{G_t(ft)}{\max Gt} C(ft), \quad \alpha_1(t) = -\beta \frac{G_r(ft)}{\max Gr}$$

with  $G_r(t) = \tanh[\sigma_r \cos(2\pi t + \Phi)]$ ,

$$G_t(t) = \int_t \tanh[\sigma_t \cos(2\pi t')] dt'$$

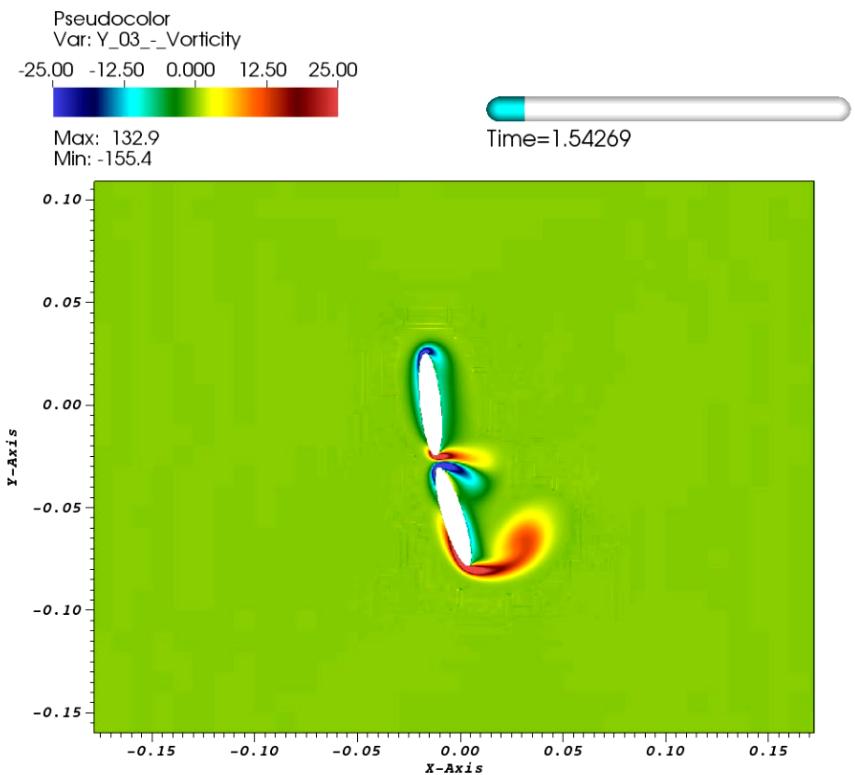

- ▶ 7 cases constructed by varying  $\sigma_r$ ,  $\sigma_t$ ,  $\Phi$
  - ▶ Rotational Reynolds number  
 $\text{Re}_r = 2\pi\beta\sigma_r f c^2 / (\tanh(\sigma_r)\nu)$  varied between 2200 and 7200 in experiments
  - ▶ [Toomey and Eldredge, 2008] reference simulations with a viscous particle method are for  $\text{Re}_r = \{100, 500\}$

$A_0$ (cm)	7.1
$c$ (cm)	5.1
$d$ (cm)	0.25
$\rho_b$ (kg/m <sup>3</sup> )	5080
$f$ (Hz)	0.15

## Case 1 - $\sigma_r = \sigma_t = 0.628$ , $\Phi = 0$ , $Re_r = 100$

- ▶ Quiescent water  
 $\rho_f = 997 \text{ kg/m}^3$   
 $c_s = 1497 \text{ m/s}$
- ▶ No-slip boundaries in  $y$ , periodic in  $x$ -direction
- ▶ Base level:  
 $100 \times 100$  for  
 $[-0.5, 0.5] \times$   
 $[-0.5, 0.5]$  domain
- ▶ 4 additional levels with factors 2,2,2,4
- ▶ Coupling to rigid body motion solver on 4th level

Right: computed vorticity field (enlarged)

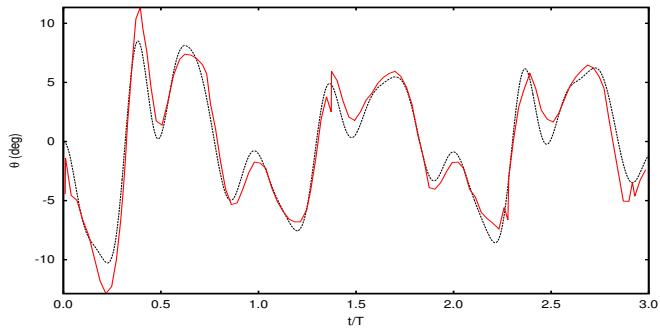

## Quantitative comparison

- ▶ Evaluate normalized force  $F_{x,y} = 2F_{x,y}^*/(\rho_f^2 c^3)$  and moment  $M = 2M^*/(\rho_f f^2 c^4)$  over 3 periods
- ▶ [Wood and Deiterding, 2015] Used finest spatial resolution  $\Delta x/c = 0.0122$
- ▶ [Toomey and Eldredge, 2008]:  $\Delta x/c = 0.013$  ( $Re_r = 100$ ),  $\Delta x/c = 0.0032$  ( $Re_r = 500$ )
- ▶ Temporal resolution  $\sim 113$  and  $\sim 28$  times finer

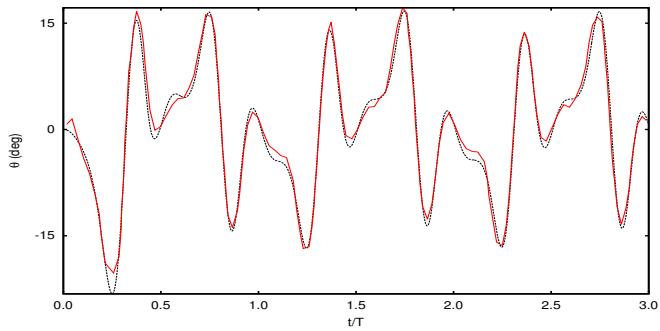

Hinge deflection angle  
over time

Case 1  
 $\sigma_t = 0.628$   
 $\sigma_r = 0.628$   
 $\Phi = 0$

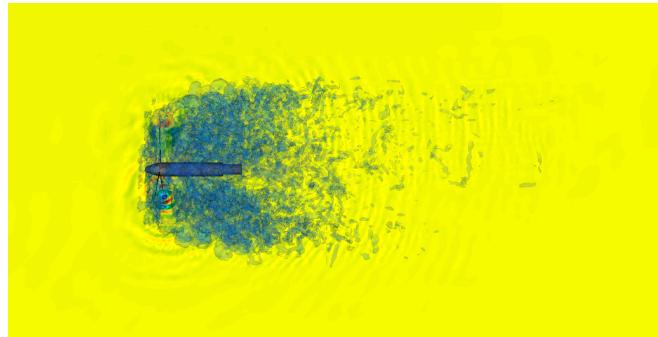

Case 2  
 $\sigma_t = 1.885$   
 $\sigma_r = 1.885$   
 $\Phi = 0^\circ$

Experimental results (—);  
Current (---)

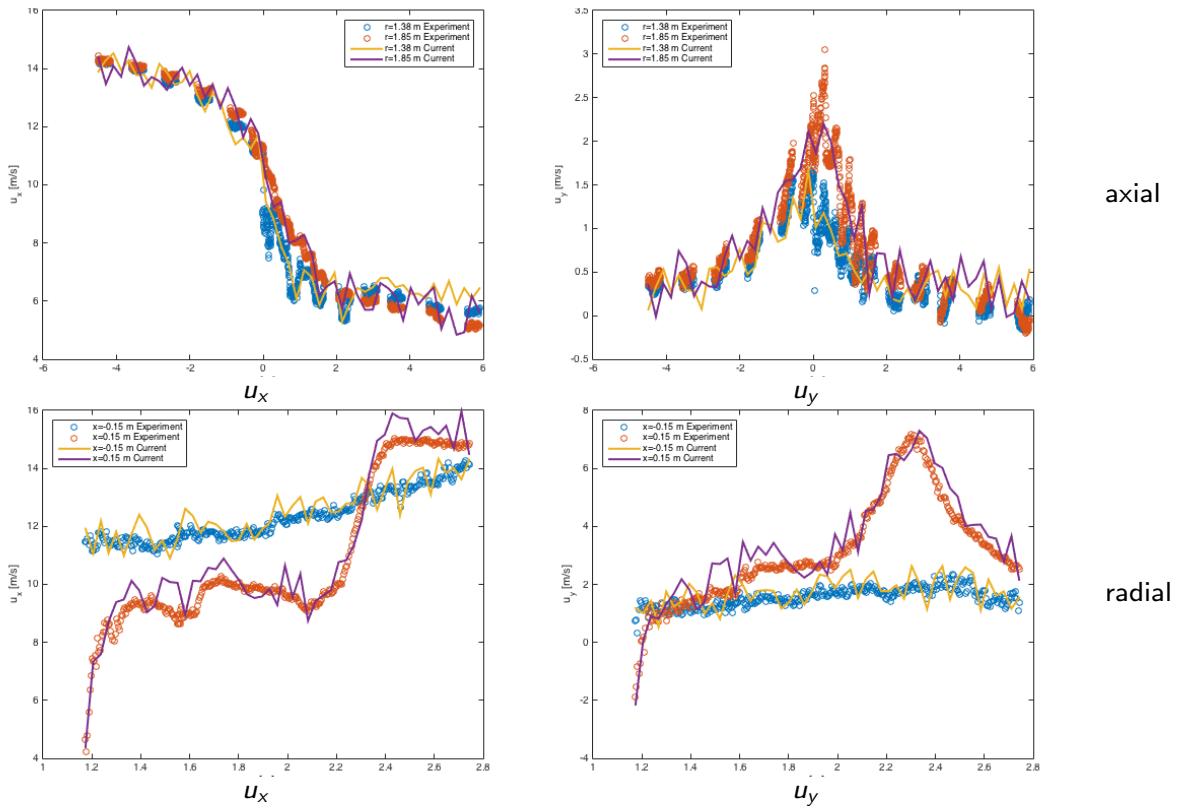

## Mexico experimental turbine – $0^\circ$ inflow

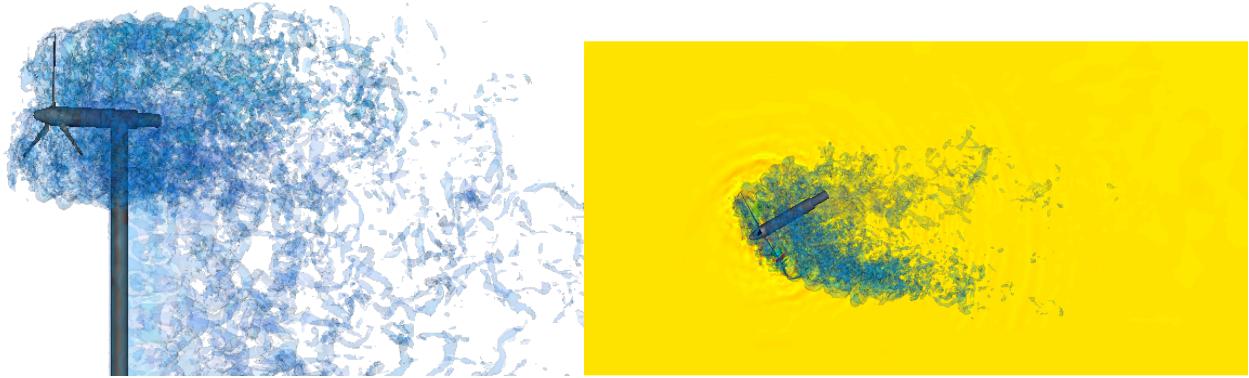

- ▶ Setup and measurements by Energy Research Centre of the Netherlands (ECN) and the Technical University of Denmark (DTU) [Schepers and Boorsma, 2012]
- ▶ Inflow velocity 14.93 m/s in wind tunnel of 9.5 m  $\times$  9.5 m cross section.
- ▶ Rotor diameter  $D = 4.5\text{m}$ . Prescribed motion with 424.5 rpm: tip speed 100 m/s,  $\text{Re}_r \approx 75839$  TSR 6.70
- ▶ Simulation with three additional levels with  $r_l = \{2, 2, 4\}$ . Resolution of rotor and tower  $\Delta x = 1.6\text{ cm}$
- ▶ 149.5 h on 120 cores Intel-Xeon (17490 h CPU) for 10 s
- ▶ Blade loads:  $F_x$ : Ref = 1516.76 N, cur. = 1632.71 N (7.6%)
- ▶  $T_x$ : Ref = 284.60 Nm, cur. = 307.87 Nm (8.1%)

# Comparison along transects – 0° inflow

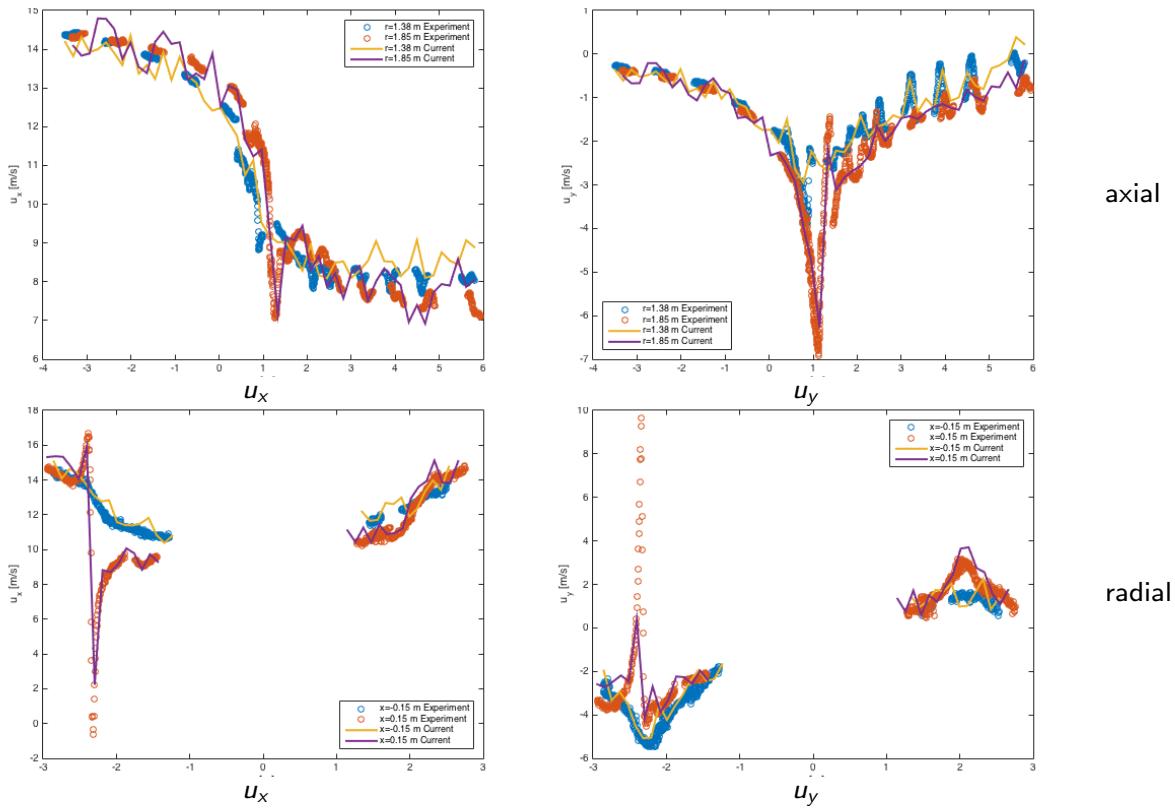

## Mexico experimental turbine – 30° yaw

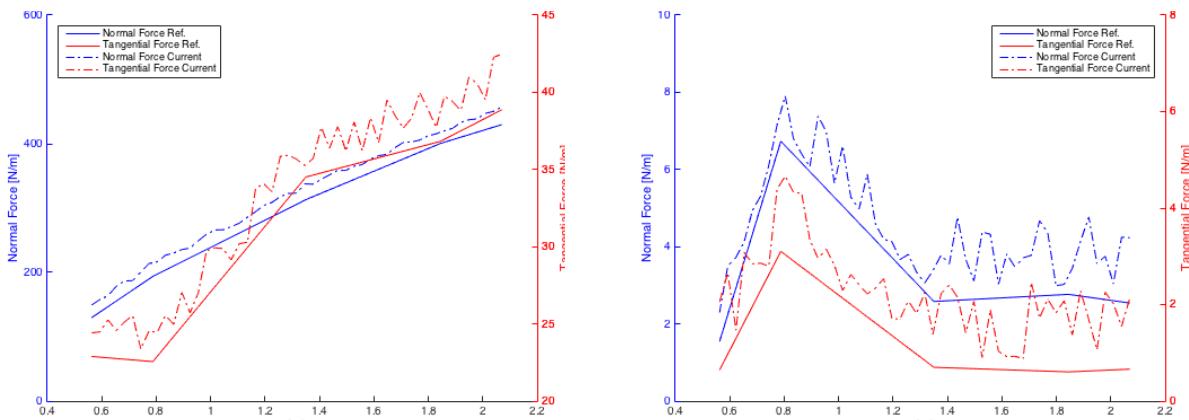

- ▶ Load collected as average during  $t \in [5, 10]$  on blade 1 as it passes through  $\theta = 0^\circ$  (pointing vertically upwards), 35 rotations
- ▶ Blade loads:  $F_x$ : Ref = 13.66 N, cur. = 14.8 N (8.3%)
- ▶  $T_x$ : Ref = 7.72 Nm, cur. = 8.36 Nm (8.3%)
- ▶ Level 0: 768,000 cells  
Level 1: 1,524,826 cells  
Level 2: 6,832,602 cells  
Level 3: 3,019,205 cells

# Comparison along transects – $30^\circ$ yaw

## Normalized %-error along transects

		0°		30°	
yaw transect		in	out	in	out
Axial	$u_x$	6.416	7.663	5.742	6.410
	$u_y$	3.400	4.061	3.043	3.373
	$u_z$	3.073	3.678	2.752	3.068
		up	down	up	down
Radial	$u_x$	6.556	7.325	7.093	6.655
	$u_y$	3.409	3.809	3.684	3.466
	$u_z$	3.242	3.659	3.511	3.294

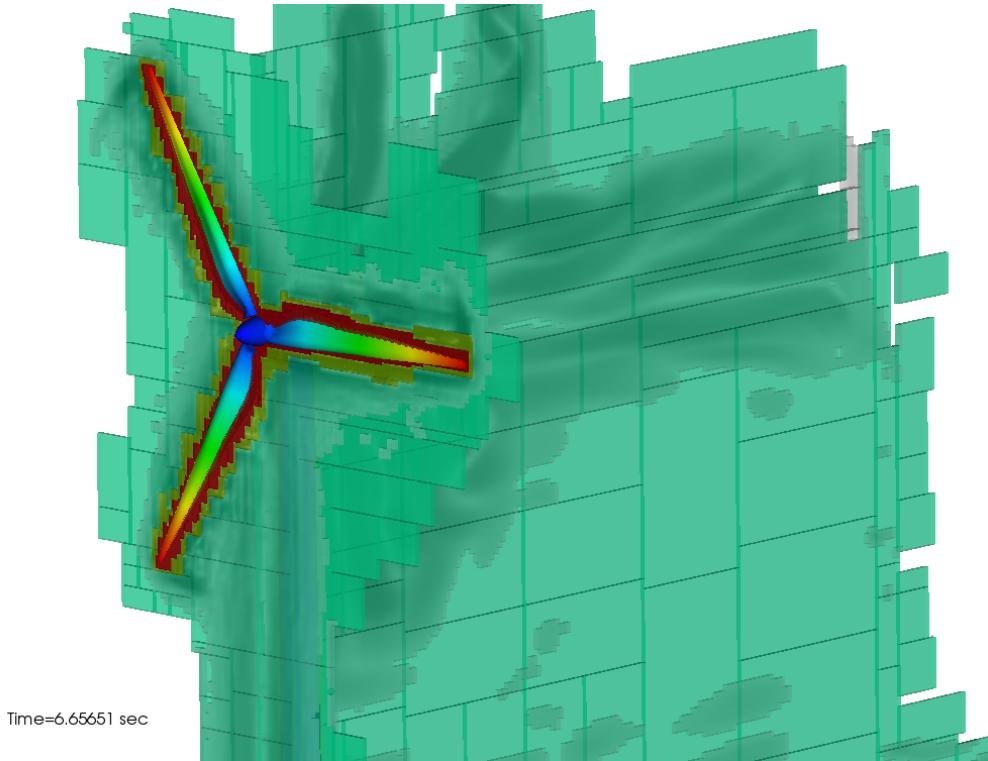

Comparison of normal and tangential forces on sections of blade 1 when  $\theta_x = 0^\circ$  (pointing vertically upward) in aligned (left) and yaw  $30^\circ$

# Simulation of a single turbine

- ▶ Geometry from realistic Vestas V27 turbine. Rotor diameter 27 m, tower height  $\sim 35$  m. Ground considered.
- ▶ Prescribed motion of rotor with 15 rpm. Inflow velocity 7 m/s.
- ▶ Simulation domain 200 m  $\times$  100 m  $\times$  100 m.
- ▶ Base mesh 400  $\times$  200  $\times$  200 cells with refinement factors 2,2,4. Resolution of rotor and tower  $\Delta x = 3.125$  cm.
- ▶ 141,344 highest level iterations to  $t_e = 30$  s computed.

# Adaptive refinement

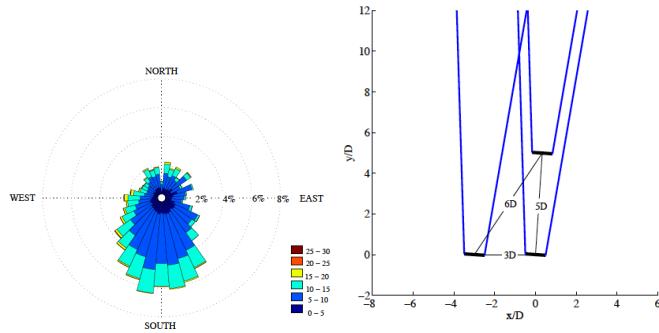

Dynamic evolution of refinement blocks (indicated by color).

# Simulation of the SWIFT array

- ▶ Three Vestas V27 turbines. 225 kW power generation at wind speeds 14 to 25 m/s (then cut-off)
- ▶ Prescribed motion of rotor with 33 and 43 rpm. Inflow velocity 8 and 25 m/s
- ▶ TSR: 5.84 and 2.43,  $Re_r \approx 919,700$  and 1,208,000
- ▶ Simulation domain 448 m × 240 m × 100 m
- ▶ Base mesh 448 × 240 × 100 cells with refinement factors 2,2,4. Resolution of rotor and tower  $\Delta x = 6.25$  cm
- ▶ 94,224 highest level iterations to  $t_e = 40$  s computed, then statistics are gathered for 10 s [Deiterding and Wood, 2015]

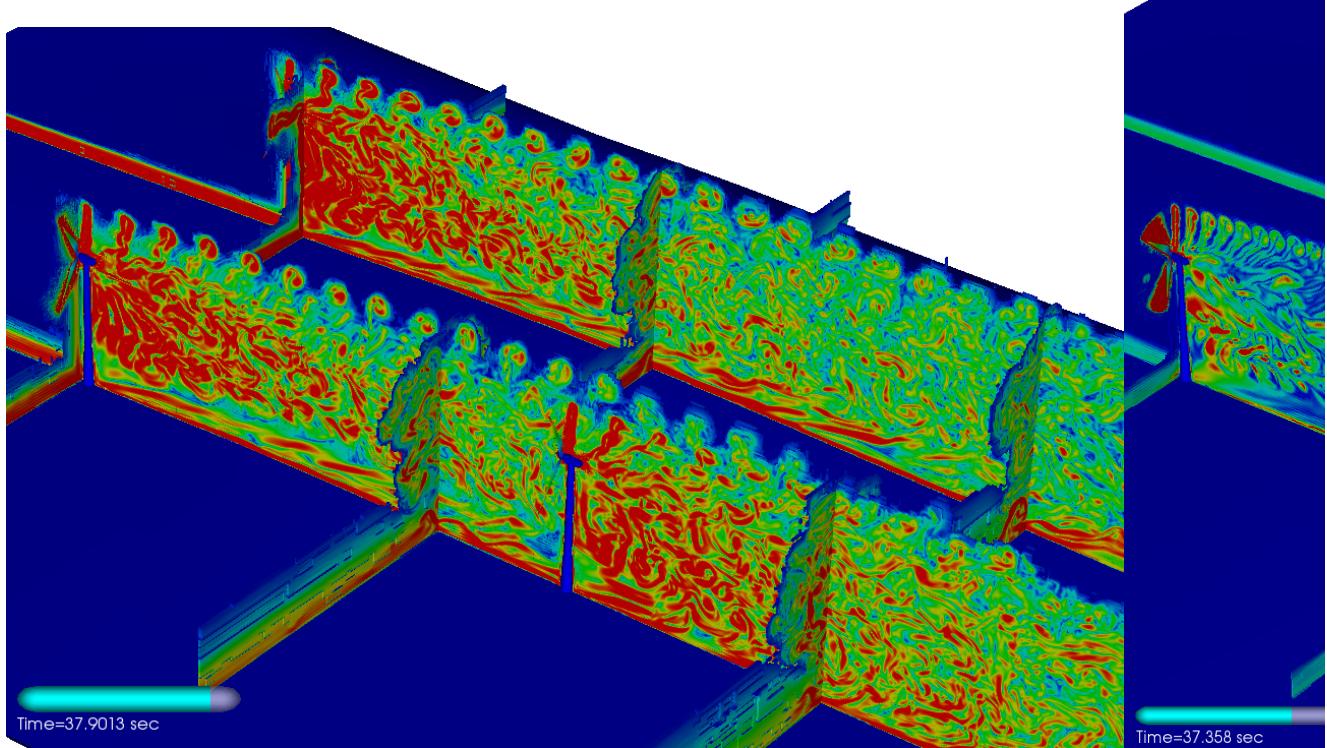

## Wake propagation through array – 25 m/s, 43 rpm

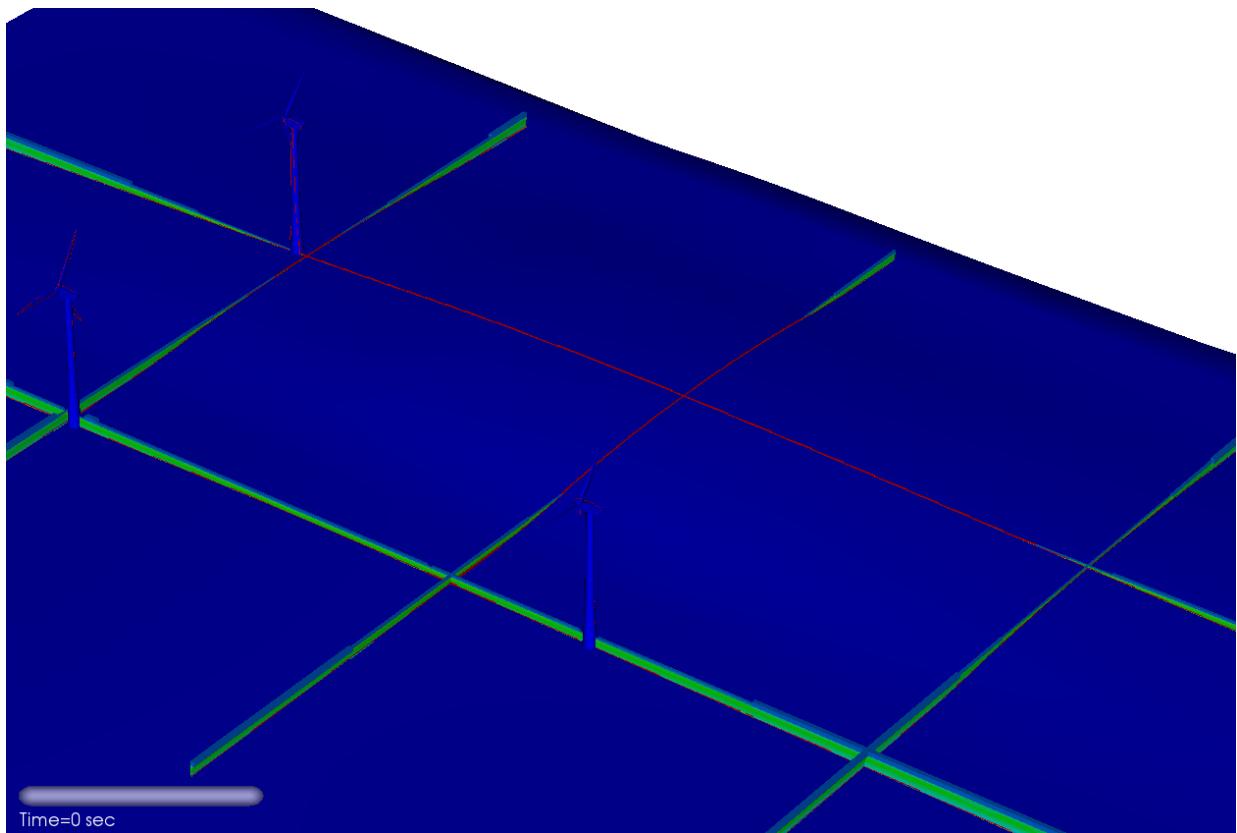

- ▶ On 288 cores Intel Xeon-Ivybridge 10 s in 38.5 h (11,090 h CPU)
- ▶ Only levels 0 and 1 used for iso-surface visualization
- ▶ At  $t_e$  approximately 140M cells used vs. 44 billion (factor 315)
- ▶ Only levels 0 and 1 used for iso-surface visualization

Level	Grids	Cells
0	3,234	10,752,000
1	11,921	21,020,256
2	66,974	102,918,568
3	896	5,116,992

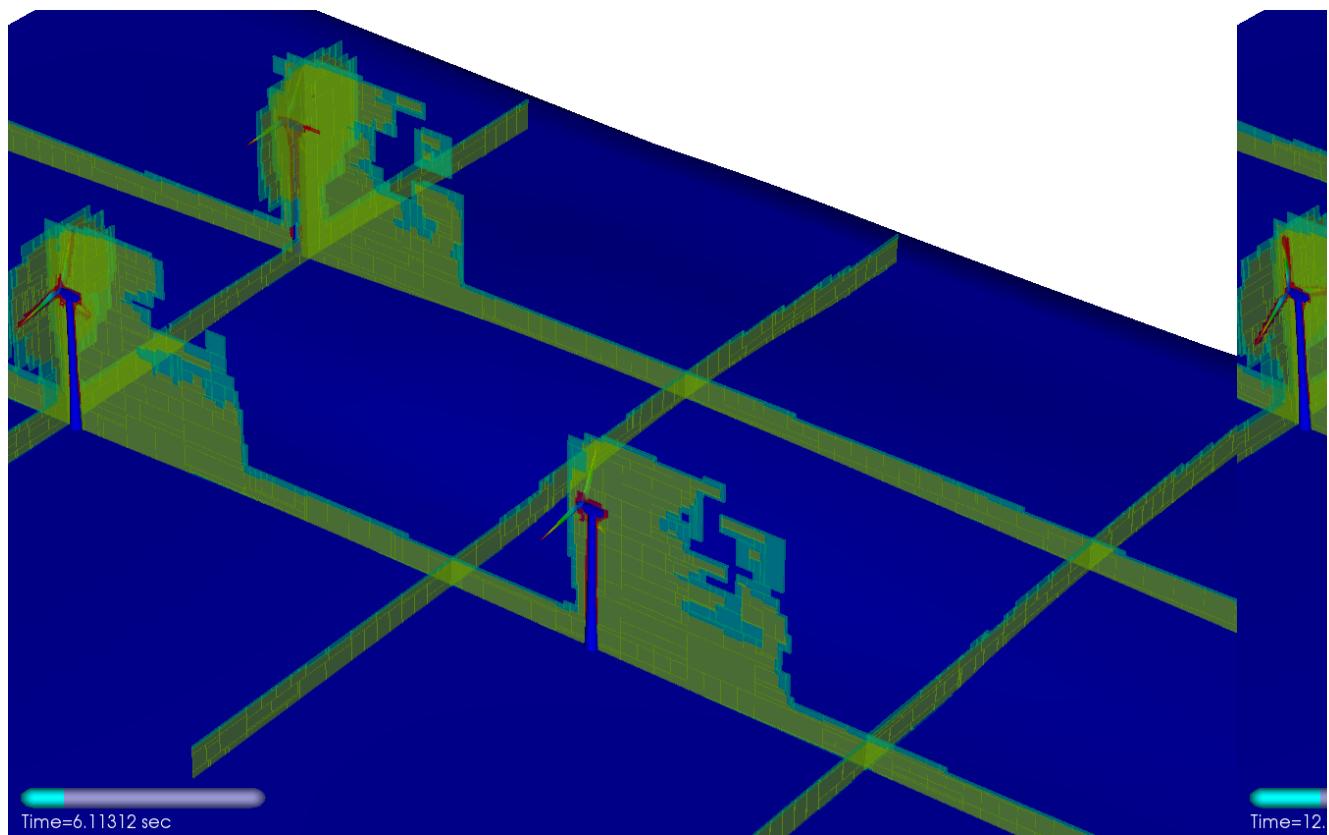

Vorticity generation -  $u = 8 \text{ m/s}$ ,  $33 \text{ rpm}$   $\mu = 25 \text{ m/s}$ ,  
 $43 \text{ rpm}$

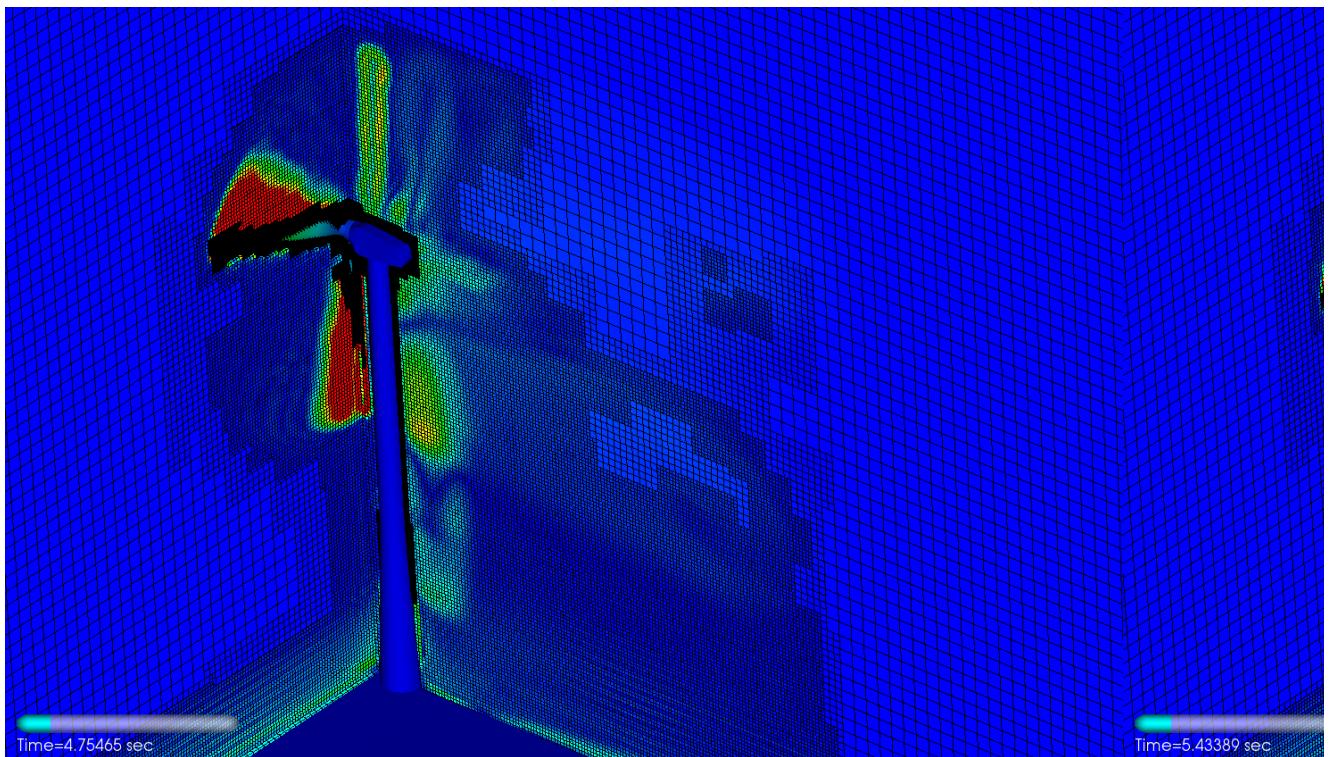

# Vorticity development - $u = 8 \text{ m/s}$ , 33 rpm

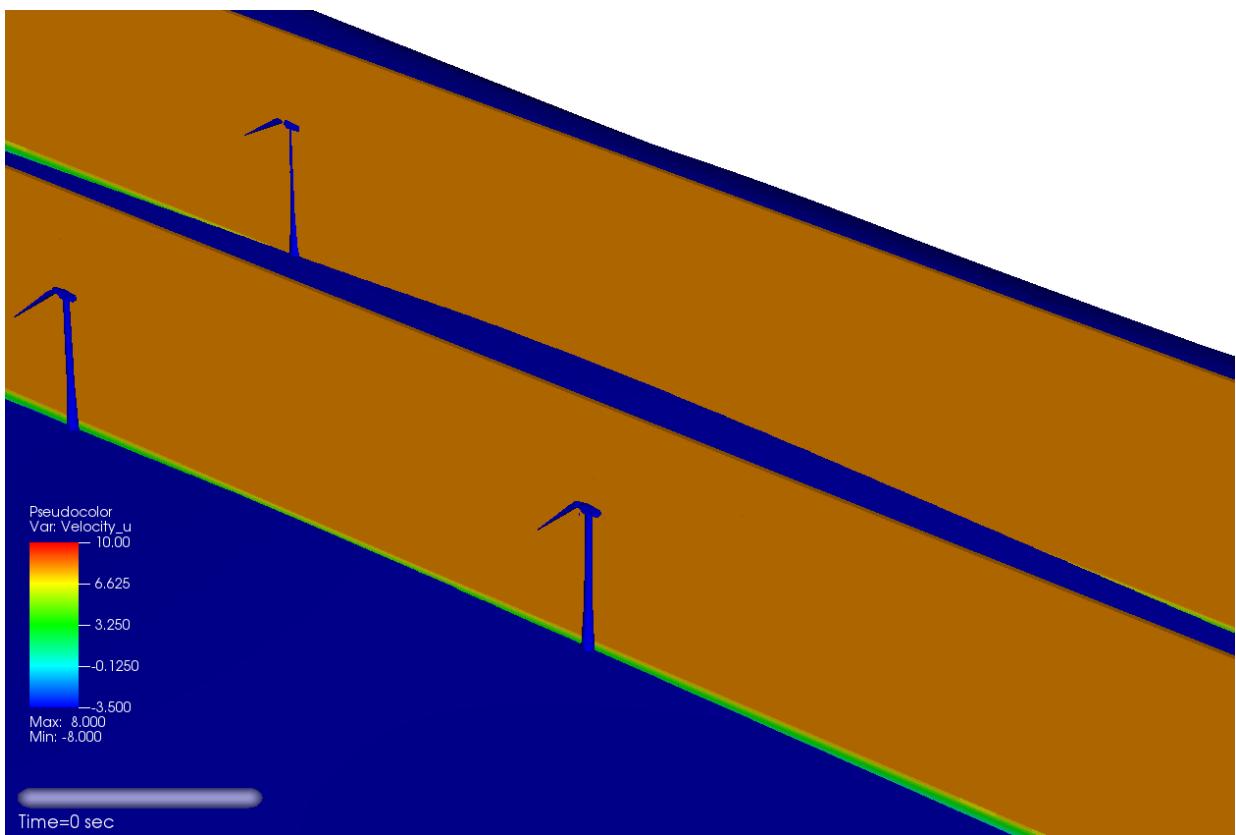

# Refinement $u = 8 \text{ m/s}$ , 33 rpm

## Wake refinement behind a leading turbine

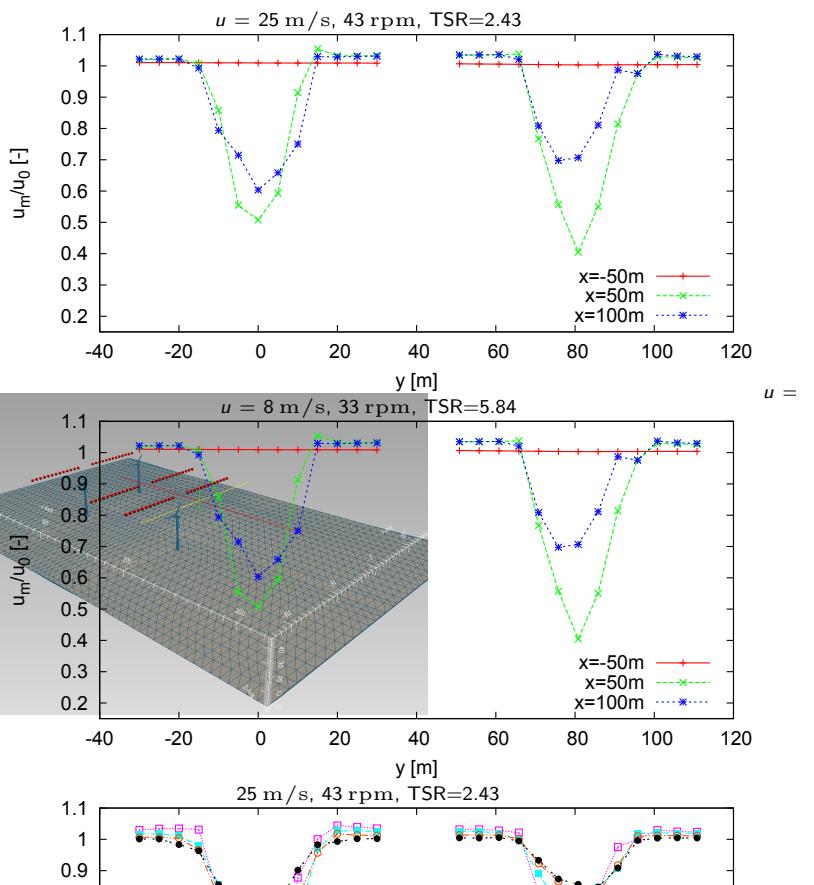

# Axial velocity - $u = 8 \text{ m/s}$ , 33 rpm

# Mean point values

- ▶ Turbines located at  $(0, 0, 0)$ ,  $(135, 0, 0)$ ,  $(-5.65, 80.80, 0)$
- ▶ Lines of 13 sensors with  $\Delta y = 5 \text{ m}$ ,  $z = 37 \text{ m}$  (approx. center of rotor)
- ▶  $u$  and  $p$  measured over  $[40 \text{ s}, 50 \text{ s}]$  (1472 level-0 time steps) and averaged

# Poisson equation

$$\begin{aligned}\Delta q(\mathbf{x}) &= \psi(\mathbf{x}), \quad \mathbf{x} \in \Omega \subset \mathbb{R}^d, \quad q \in C^2(\Omega), \quad \psi \in C^0(\Omega) \\ q &= \psi^\Gamma(\mathbf{x}), \quad \mathbf{x} \in \partial\Omega\end{aligned}$$

Discrete Poisson equation in 2D:

$$\frac{Q_{j+1,k} - 2Q_{jk} + Q_{j-1,k}}{\Delta x_1^2} + \frac{Q_{j,k+1} - 2Q_{jk} + Q_{j,k-1}}{\Delta x_2^2} = \psi_{jk}$$

Operator

$$\mathcal{A}(Q_{\Delta x_1, \Delta x_2}) = \begin{bmatrix} & \frac{1}{\Delta x_2^2} & \\ \frac{1}{\Delta x_1^2} & -\left(\frac{2}{\Delta x_1^2} + \frac{2}{\Delta x_2^2}\right) & \frac{1}{\Delta x_2^2} \\ & \frac{1}{\Delta x_2^2} & \end{bmatrix} Q(x_{1,j}, x_{2,k}) = \psi_{jk}$$

$$Q_{jk} = \frac{1}{\sigma} \left[ (Q_{j+1,k} + Q_{j-1,k}) \Delta x_2^2 + (Q_{j,k+1} + Q_{j,k-1}) \Delta x_1^2 - \Delta x_1^2 \Delta x_2^2 \psi_{jk} \right]$$

$$\text{with } \sigma = \frac{2\Delta x_1^2 + 2\Delta x_2^2}{\Delta x_1^2 \Delta x_2^2}$$

# Iterative methods

Jacobi iteration

$$Q_{jk}^{m+1} = \frac{1}{\sigma} \left[ (Q_{j+1,k}^m + Q_{j-1,k}^m) \Delta x_2^2 + (Q_{j,k+1}^m + Q_{j,k-1}^m) \Delta x_1^2 - \Delta x_1^2 \Delta x_2^2 \psi_{jk} \right]$$

Lexicographical Gauss-Seidel iteration (use updated values when they become available)

$$Q_{jk}^{m+1} = \frac{1}{\sigma} \left[ (Q_{j+1,k}^m + Q_{j-1,k}^{m+1}) \Delta x_2^2 + (Q_{j,k+1}^m + Q_{j,k-1}^{m+1}) \Delta x_1^2 - \Delta x_1^2 \Delta x_2^2 \psi_{jk} \right]$$

Efficient parallelization / patch-wise application not possible!

Checker-board or Red-Black Gauss Seidel iteration

1.  $Q_{jk}^{m+1} = \frac{1}{\sigma} \left[ (Q_{j+1,k}^m + Q_{j-1,k}^m) \Delta x_2^2 + (Q_{j,k+1}^m + Q_{j,k-1}^m) \Delta x_1^2 - \Delta x_1^2 \Delta x_2^2 \psi_{jk} \right]$   
for  $j + k \bmod 2 = 0$
2.  $Q_{jk}^{m+1} = \frac{1}{\sigma} \left[ (Q_{j+1,k}^{m+1} + Q_{j-1,k}^{m+1}) \Delta x_2^2 + (Q_{j,k+1}^{m+1} + Q_{j,k-1}^{m+1}) \Delta x_1^2 - \Delta x_1^2 \Delta x_2^2 \psi_{jk} \right]$   
for  $j + k \bmod 2 = 1$

Gauss-Seidel methods require  $\sim 1/2$  of iterations than Jacobi method, however, iteration count still proportional to number of unknowns [Hackbusch, 1994]

# Smoothing vs. solving

$\nu$  iterations with iterative linear solver

$$Q^{m+\nu} = \mathcal{S}(Q^m, \psi, \nu)$$

Defect after  $m$  iterations

$$d^m = \psi - \mathcal{A}(Q^m)$$

Defect after  $m + \nu$  iterations

$$d^{m+\nu} = \psi - \mathcal{A}(Q^{m+\nu}) = \psi - \mathcal{A}(Q^m + v_\nu^m) = d^m - \mathcal{A}(v_\nu^m)$$

with correction

$$v_\nu^m = \mathcal{S}(\vec{0}, d^m, \nu)$$

Neglecting the sub-iterations in the smoother we write

$$Q^{n+1} = Q^n + v = Q^n + \mathcal{S}(d^n)$$

Observation: Oscillations are damped faster on coarser grid.

Coarse grid correction:

$$Q^{n+1} = Q^n + v = Q^n + \mathcal{PSR}(d^n)$$

where  $\mathcal{R}$  is suitable restriction operator and  $\mathcal{P}$  a suitable prolongation operator

# Two-grid correction method

Relaxation on current grid:

$$\bar{Q} = \mathcal{S}(Q^n, \psi, \nu)$$

$$Q^{n+1} = \bar{Q} + \mathcal{P}\mathcal{S}(\vec{0}, \cdot, \mu)\mathcal{R}(\psi - \mathcal{A}(\bar{Q}))$$

Algorithm:

$$\begin{aligned} \bar{Q} &:= \mathcal{S}(Q^n, \psi, \nu) \\ d &:= \psi - \mathcal{A}(\bar{Q}) \\ d_c &:= \mathcal{R}(d) \\ v_c &:= \mathcal{S}(0, d_c, \mu) \\ v &:= \mathcal{P}(v_c) \\ Q^{n+1} &:= \bar{Q} + v \end{aligned}$$

with smoothing:

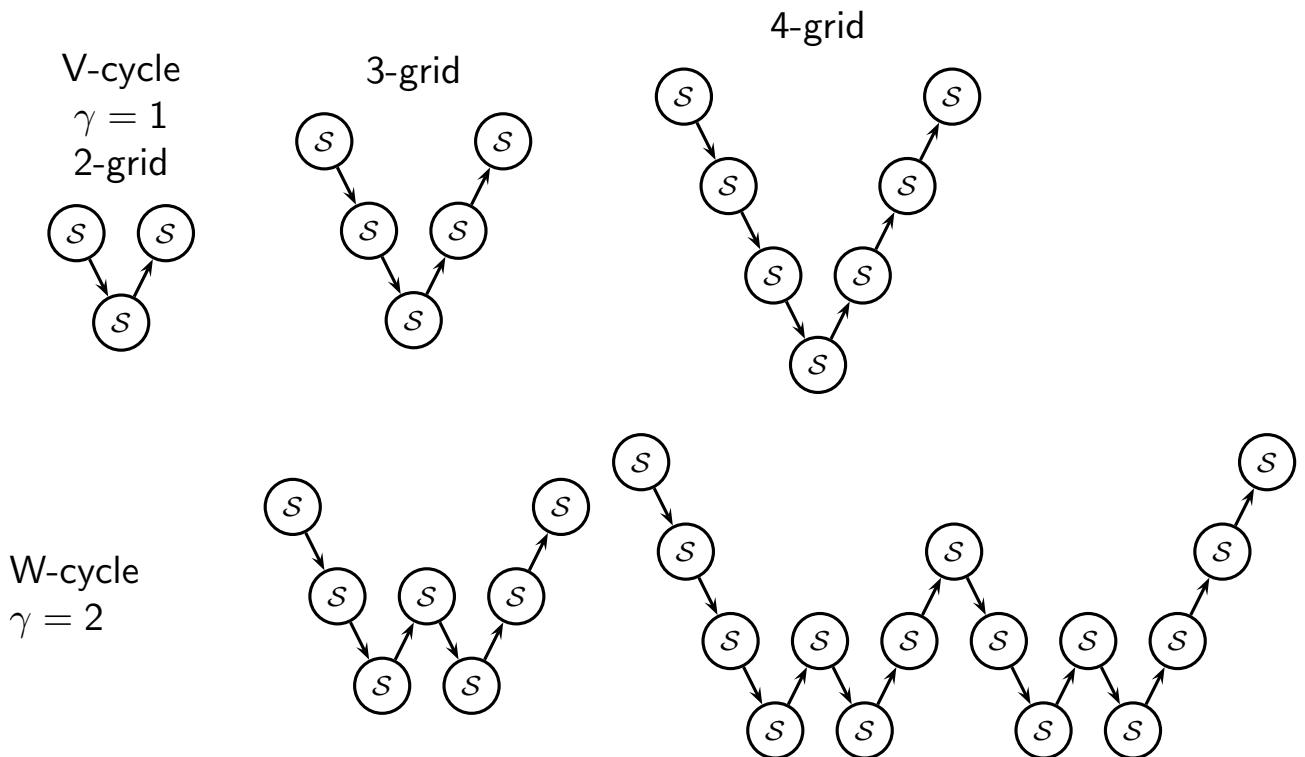

$$\begin{aligned} d &:= \psi - \mathcal{A}(Q) \\ v &:= \mathcal{S}(0, d, \nu) \\ r &:= d - \mathcal{A}(v) \\ d_c &:= \mathcal{R}(r) \\ v_c &:= \mathcal{S}(0, d_c, \mu) \\ v &:= v + \mathcal{P}(v_c) \\ Q^{n+1} &:= Q + v \end{aligned}$$

with pre- and post-iteration:

$$\begin{aligned} d &:= \psi - \mathcal{A}(Q) \\ v &:= \mathcal{S}(0, d, \nu_1) \\ r &:= d - \mathcal{A}(v) \\ d_c &:= \mathcal{R}(r) \\ v_c &:= \mathcal{S}(0, d_c, \mu) \\ v &:= v + \mathcal{P}(v_c) \\ d &:= d - \mathcal{A}(v) \\ r &:= \mathcal{S}(0, d, \nu_2) \\ Q^{n+1} &:= Q + v + r \end{aligned}$$

[Hackbusch, 1985]

# Multi-level methods and cycles

[Hackbusch, 1985] [Wesseling, 1992] ...

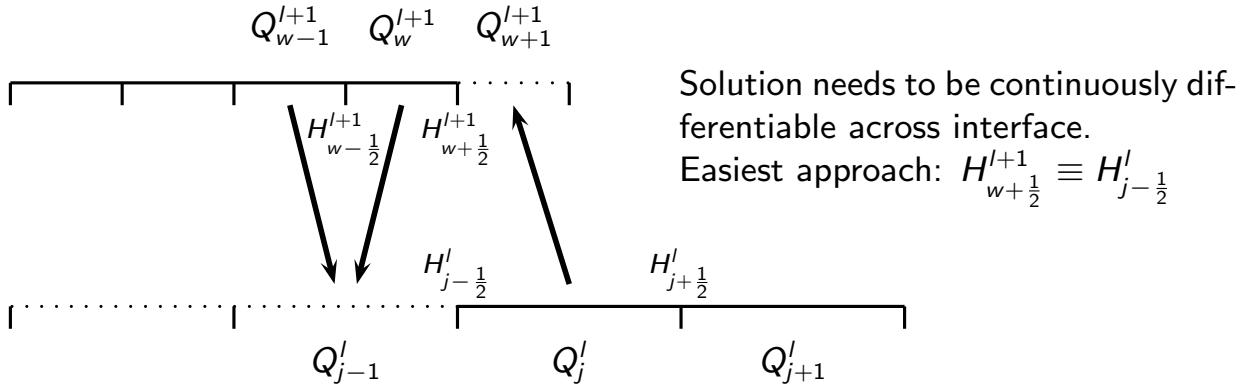

# Stencil modification at coarse-fine boundaries in 1D

1D Example: Cell  $j$ ,  $\psi - \nabla \cdot \nabla q = 0$

$$d_j^l = \psi_j - \frac{1}{\Delta x_l} \left( \frac{1}{\Delta x_l} (Q_{j+1}^l - Q_j^l) - \frac{1}{\Delta x_l} (Q_j^l - Q_{j-1}^l) \right) = \psi_j - \frac{1}{\Delta x_l} (H_{j+\frac{1}{2}}^l - H_{j-\frac{1}{2}}^l)$$

$H$  is approximation to *derivative* of  $Q^l$ .

Consider 2-level situation with  $r_{l+1} = 2$ :

No specific modification necessary for 1D vertex-based stencils, cf.  
[Bastian, 1996]

## Stencil modification at coarse-fine boundaries in 1D II

Set  $H_{w+\frac{1}{2}}^{l+1} = H_{\mathcal{I}}$ . Inserting  $Q$  gives

$$\frac{Q_{w+1}^{l+1} - Q_w^{l+1}}{\Delta x_{l+1}} = \frac{Q_j^l - Q_w^{l+1}}{\frac{3}{2}\Delta x_{l+1}}$$

from which we readily derive

$$Q_{w+1}^{l+1} = \frac{2}{3}Q_j^l + \frac{1}{3}Q_w^{l+1}$$

for the boundary cell on  $l+1$ . We use the flux correction procedure to enforce  $H_{w+\frac{1}{2}}^{l+1} \equiv H_{j-\frac{1}{2}}^l$  and thereby  $H_{j-\frac{1}{2}}^l \equiv H_{\mathcal{I}}$ .

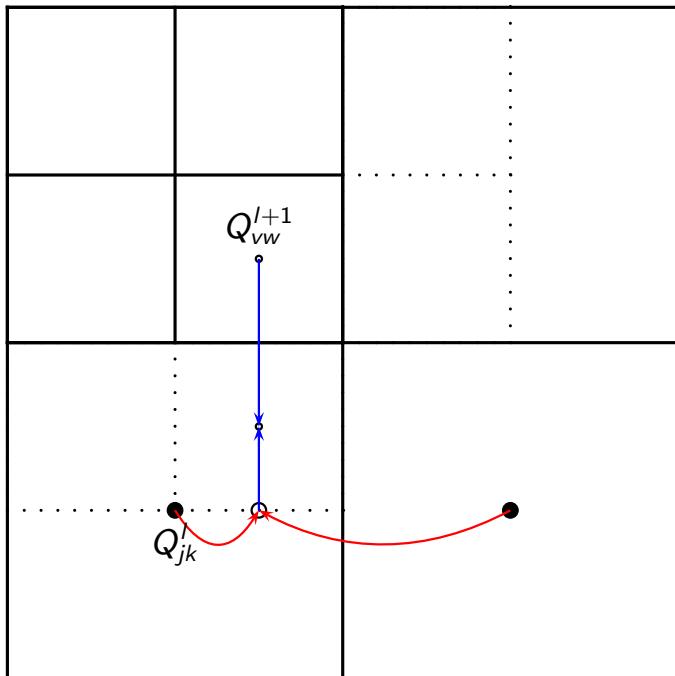

Correction pass [Martin, 1998]

1.  $\delta H_{j-\frac{1}{2}}^{l+1} := -H_{j-\frac{1}{2}}^l$
2.  $\delta H_{j-\frac{1}{2}}^{l+1} := \delta H_{j-\frac{1}{2}}^{l+1} + H_{w+\frac{1}{2}}^{l+1} = -H_{j-\frac{1}{2}}^l + (Q_j^l - Q_w^{l+1})/\frac{3}{2}\Delta x_{l+1}$
3.  $\check{d}_j^l := d_j^l + \frac{1}{\Delta x_l} \delta H_{j-\frac{1}{2}}^{l+1}$

yields

$$\check{d}_j^l = \psi_j - \frac{1}{\Delta x_l} \left( \frac{1}{\Delta x_l} (Q_{j+1}^l - Q_j^l) - \frac{2}{3\Delta x_{l+1}} (Q_j^l - Q_w^{l+1}) \right)$$

## Stencil modification at coarse-fine boundaries: 2D

$$Q_{v,w-1}^{l+1} = \frac{1}{3} Q_{vw}^{l+1} + \frac{2}{3} \left( \frac{3}{4} Q_{jk}^l + \frac{1}{4} Q_{j+1,k}^l \right)$$

In general:

$$Q_{v,w-1}^{l+1} = \left( 1 - \frac{2}{r_{l+1} + 1} \right) Q_{vw}^{l+1} + \frac{2}{r_{l+1} + 1} \left( (1 - f) Q_{jk}^l + f Q_{j+1,k}^l \right)$$

with

$$f = \frac{x_{1,l+1}^v - x_{1,l}^j}{\Delta x_{1,l}}$$

# Components of an SAMR multigrid method

- ▶ Stencil operators
  - ▶ Application of defect  $d^l = \psi^l - \mathcal{A}(Q^l)$  on each grid  $G_{l,m}$  of level  $l$
  - ▶ Computation of correction  $v^l = \mathcal{S}(0, d^l, \nu)$  on each grid of level  $l$
- ▶ Boundary (ghost cell) operators
  - ▶ Synchronization of  $Q^l$  and  $v^l$  on  $\tilde{S}_l^1$
  - ▶ Specification of Dirichlet boundary conditions for a finite volume discretization for  $Q^l \equiv w$  and  $v^l \equiv w$  on  $\tilde{P}_l^1$
  - ▶ Specification of  $v^l \equiv 0$  on  $\tilde{I}_l^1$
  - ▶ Specification of  $Q_l = \frac{(r_l-1)Q^{l+1} + 2Q^l}{r_l+1}$  on  $\tilde{I}_l^1$
- ▶ Coarse-fine boundary flux accumulation and application of  $\delta H^{l+1}$  on defect  $d^l$
- ▶ Standard prolongation and restriction on grids between adjacent levels
- ▶ Adaptation criteria
  - ▶ E.g., standard restriction to project solution on 2x coarsened grid, then use local error estimation
- ▶ Looping instead of time steps and check of convergence

# Additive geometric multigrid algorithm

`AdvanceLevelMG( $l$ ) - Correction Scheme`

Set ghost cells of  $Q^l$

Calculate defect  $d^l$  from  $Q^l, \psi^l$

$$d^l := \psi^l - \mathcal{A}(Q^l)$$

If ( $l < l_{max}$ )

Calculate updated defect  $r^{l+1}$  from  $v^{l+1}, d^{l+1}$

$$r^{l+1} := d^{l+1} - \mathcal{A}(v^{l+1})$$

Restrict  $d^{l+1}$  onto  $d^l$

$$d^l := \mathcal{R}_l^{l+1}(r^{l+1})$$

Do  $\nu_1$  smoothing steps to get correction  $v^l$

$$v^l := \mathcal{S}(0, d^l, \nu_1)$$

If ( $l > l_{min}$ )

Do  $\gamma > 1$  times

`AdvanceLevelMG( $l - 1$ )`

Set ghost cells of  $v^{l-1}$

Prolongate and add  $v^{l-1}$  to  $v^l$

$$v^l := v^l + \mathcal{P}_l^{l-1}(v^{l-1})$$

If ( $\nu_2 > 0$ )

Set ghost cells of  $v^l$

Update defect  $d^l$  according to  $v^l$

$$d^l := d^l - \mathcal{A}(v^l)$$

Do  $\nu_2$  post-smoothing steps to get  $r^l$

$$r^l := \mathcal{S}(v^l, d^l, \nu_2)$$

Add additional correction  $r^l$  to  $v^l$

$$v^l := v^l + r^l$$

Add correction  $v^l$  to  $Q^l$

$$Q^l := Q^l + v^l$$

# Additive Geometric Multiplicative Multigrid Algorithm

Start - Start iteration on level  $l_{max}$

```
For  $l = l_{max}$  Downto  $l_{min} + 1$  Do
    Restrict  $Q^l$  onto  $Q^{l-1}$ 
    Regrid(0)
    AdvanceLevelMG( $l_{max}$ )
```

Vertex-based: [Brandt, 1977], [Briggs et al., 2001]

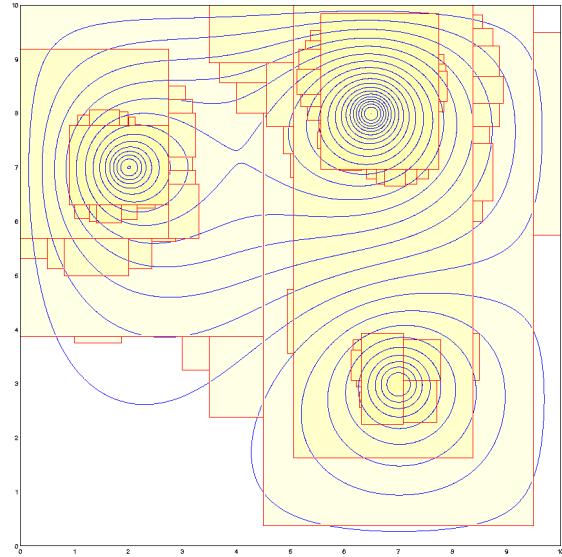

# Example

On  $\Omega = [0, 10] \times [0, 10]$  use hat function

$$\psi = \begin{cases} -A_n \cos\left(\frac{\pi r}{2R_n}\right), & r < R_n \\ 0 & \text{elsewhere} \end{cases}$$

with  $r = \sqrt{(x_1 - X_n)^2 + (x_2 - Y_n)^2}$   
to define three sources with

n	$A_n$	$R_n$	$X_n$	$Y_n$
1	0.3	0.3	6.5	8.0
2	0.2	0.3	2.0	7.0
3	-0.1	0.4	7.0	3.0

	$128 \times 128$	$1024 \times 1024$	$1024 \times 1024$
$I_{max}$	3	0	0
$I_{min}$	-4	-7	-4
$\nu_1$	5	5	5
$\nu_2$	5	5	5
V-Cycles	15	16	341
Time [sec]	9.4	27.7	563

Stop at  $\|d^l\|_{max} < 10^{-7}$  for  $l \geq 0$ ,  $\gamma = 1$ ,  $r_l = 2$

# Some comments on parabolic problems

- ▶ Consequences of time step refinement
- ▶ Level-wise elliptic solves vs. global solve
- ▶ If time step refinement is used an elliptic flux correction is unavoidable.
- ▶ The correction is explained in Bell, J. (2004). Block-structured adaptive mesh refinement. Lecture 2. Available at <https://ccse.llnl.gov/people/jbb/shortcourse/lecture2.pdf>.
